Chapter 1: Affine Algebraic Sets

1.1. Algebraic Preliminaries

Problem 1.1.*

Let R be a domain.

(a) *If f, g are forms of degree r, s respectively in $R[x_1, \ldots, x_n]$, show that fg is a form of degree $r + s$.*

(b) *Show that any factor of a form in $R[x_1, \ldots, x_n]$ is also a form.*

Proof of (a).

(1) Write

$$f = \sum_{(i)} a_{(i)} x^{(i)},$$
$$g = \sum_{(j)} b_{(j)} x^{(j)},$$

where $\sum_{(i)}$ is the summation over $(i) = (i_1, \ldots, i_n)$ with $i_1 + \cdots + i_n = r$ and $\sum_{(j)}$ is the summation over $(j) = (j_1, \ldots, j_n)$ with $j_1 + \cdots + j_n = s$.

(2) Hence,

$$\begin{aligned} fg &= \sum_{(i)} \sum_{(j)} a_{(i)} b_{(j)} x^{(i)} x^{(j)} \\ &= \sum_{(i),(j)} a_{(i)} b_{(j)} x^{(k)} \end{aligned}$$

where $(k) = (i_1 + j_1, \ldots, i_n + j_n)$ with $(i_1 + j_1) + \cdots + (i_n + j_n) = r + s$. Each $x^{(k)}$ is the form of degree $r + s$ and $a_{(i)} b_{(j)} \in R$. Hence fg is a form of degree $r + s$.

□

Proof of (b).

(1) Given any form $f \in R[x_1, \ldots, x_n]$, and write $f = gh$. *It suffices to show that g is a form as well.* (So does h.)

(2) Write

$$g = g_0 + \cdots + g_r, \qquad h = h_0 + \cdots + h_s$$

where $g_r \neq 0$ and $h_s \neq 0$. So

$$f = gh = g_0h_0 + \cdots + g_rh_s.$$

Since R is a domain, $R[x_1, \ldots, x_n]$ is a domain and thus $g_rh_s \neq 0$. The maximality of r and s implies that $\deg f = r + s$. Therefore, by the maximality of $r + s$, $f = g_rh_s$, or $g = g_r$, or g is a form.

□

Problem 1.2.*

Let R be a UFD, K the quotient field of R. Show that every element z of K may be written $z = a/b$, where $a, b \in R$ have no common factors; this representative is unique up to units of R.

Proof.

(1) *Show that every element z of K may be written $z = a/b$, where a, $b \in R$ have no common factors.* Given any $z = a/b \in K$ where $a, b \in R$. Write

$$a = p_1 \cdots p_n,$$
$$b = q_1 \cdots q_m$$

where all $p_1, \ldots, p_n, q_1, \ldots, q_m$ are irreducible in R. (It is possible since R is a UFD.) For each i, suppose $p_i \mid q_j$ for some i, j. Write $q_j = p_iu$ for some $u \in R$. By the irreducibility of p_i and q_j, u is a unit. So

$$z = \frac{a}{b} = \frac{p_1 \cdots \widehat{p_i} \cdots p_n}{q_1 \cdots \widehat{q_j} \cdots q_m} = \frac{p_1 \cdots \widehat{p_i} \cdots p_n}{uq_1 \cdots \widehat{q_j} \cdots q_m}.$$

Continue this method we can write $z = \frac{a'}{b'}$ where a' and b' have no common factors.

(2) Write $z = a/b = a'/b'$ where

   (a) $a, b, a', b' \in R$,

   (b) a and b have no common factors,

   (c) a' and b' have no common factors.

   Write

$$a = p_1 \cdots p_n,$$
$$b = q_1 \cdots q_m,$$
$$a' = p'_1 \cdots p'_{n'},$$
$$b' = q'_1 \cdots q'_{m'}$$

where all $p_i, q_j, p'_{i'}, q'_{j'}$ are irreducible in R. As $z = a/b = a'/b'$, $ab' = a'b$ or

$$p_1 \cdots p_n q'_1 \cdots q'_{m'} = p'_1 \cdots p'_{n'} q_1 \cdots q_m.$$

(3) For $i = 1$, $p_1 = u_1 p'_{i'}$ for some unit $u_1 \in R$ since a and b have no common factors and all $p_1, q_j, p'_{i'}$ are irreducible. Hence

$$u_1 \widehat{p_1} p_2 \cdots p_n q'_1 \cdots q'_{m'} = p'_1 \cdots \widehat{p'_{i'}} \cdots p'_{n'} q_1 \cdots q_m.$$

Continue this method, we have $n \leq n'$ and all $p_1, \ldots, p_n$ are canceled.

(4) Conversely, we can apply the argument in (3) to $i' = 1, \ldots n'$ to conclude that $n' \leq n$. Therefore, $n = n'$ and

$$\underbrace{u_1 \cdots u_n}_{\text{a unit in } R} q'_1 \cdots q'_{m'} = q_1 \cdots q_m.$$

Hence, $b = ub'$ where $u = u_1 \cdots u_n$ is a unit in R. Similarly, $a = va'$ where v is a unit in R. So the representative of $z \in K$ is unique up to units of R.

□

Problem 1.3.*

Let R be a PID. Let $\mathfrak{p}$ be a nonzero, proper, prime ideal in R.

(a) *Show that $\mathfrak{p}$ is generated by an irreducible element.*

(b) *Show that $\mathfrak{p}$ is maximal.*

Proof of (a).

(1) Let $\mathfrak{p} = (a)$ be a nonzero, proper, prime ideal in R. It suffices to show that a is irreducible.

(2) Suppose $a = bc$. By the primality of $\mathfrak{p}$, $b \in \mathfrak{p}$ or $c \in \mathfrak{p}$. Suppose $b \in \mathfrak{p} = (a)$. (The case $c \in \mathfrak{p}$ is similar.) Then there is a $d \in R$ such that $b = ad$. Hence, $a = bc = adc$ or $(1 - dc)a = 0$.

(3) Since R is a domain, $1 = dc$ or $a = 0$. $a = 0$ implies that $\mathfrak{p} = (0)$ is a zero ideal, contrary to the assumption. Therefore, $1 = dc$, or c is a unit, or a is irreducible.

□

Proof of (b).

(1) Given any ideal $I = (b)$ of R containing $\mathfrak{p} = (a)$. As the generator a of $\mathfrak{p}$ is in $\mathfrak{p} \subseteq I$, there is some $c \in R$ such that $a = bc$. By the irreducibility of a (in (a)), b is a unit or c is a unit.

(2) b is a unit implies that $I = R$. c is a unit implies that $I = \mathfrak{p}$. In any case, we conclude that $\mathfrak{p}$ is maximal.

□

Problem 1.4.*

Let k be an infinite field, $f \in k[x_1, \ldots, x_n]$. Suppose $f(a_1, \ldots, a_n) = 0$ for all $a_1, \ldots, a_n \in k$. Show that $f = 0$. (Hint: Write

$$f = \sum f_i x_n^i, \qquad f_i \in k[x_1, \ldots, x_{n-1}].$$

Use induction on n, and the fact that $f(a_1, \ldots, a_{n-1}, x_n)$ has only a finite number of roots if any $f_i(a_1, \ldots, a_{n-1}) \neq 0$.)

Proof.

(1) Induction on n. The case $n = 1$. (Reductio ad absurdum) If there were a nonzero $f \in k[x_1]$ such that $f(a) = 0$ for all $a \in k$. Note that f has at most $\deg f < \infty$ roots, contrary to the infinity of k.

(2) Assume that the conclusion holds for $n-1$, then for any $f \in k[x_1, \ldots, x_n]$ we can write

$$f = \sum f_i x_n^i, \qquad f_i \in k[x_1, \ldots, x_{n-1}]$$

as $f \in (k[x_1, \ldots, x_{n-1}])[x_n]$. Suppose $f(a_1, \ldots, a_n) = 0$ for all $a_1, \ldots, a_n \in k$. For fixed $a_1, \ldots, a_{n-1}$, the polynomial $f(a_1, \ldots, a_{n-1}, x_n) \in k[x_n]$ has all distinct roots in an infinite field k. By (1), $f(a_1, \ldots, a_{n-1}, x_n) = 0 \in k[x_n]$, or each $f_i(a_1, \ldots, a_{n-1}) = 0$. As all $a_1, \ldots, a_{n-1}$ run over k, we can apply the induction hypothesis each $f_i(x_1, \ldots, x_{n-1}) = 0 \in k[x_1, \ldots, x_{n-1}]$. Hence, $f = 0 \in k[x_1, \ldots, x_n]$.

□

Note. If k is a finite field of order $q = p^k$, then the polynomial $f(x) = x^q - x$ has q distinct roots in k.

Problem 1.5.*

Let k be any field. Show that there are an infinitely number of irreducible monic polynomials in $k[x]$. (Hint: Suppose $f_1, \ldots, f_n$ were all of them, and factor $f_1 \cdots f_n + 1$ into irreducible factors.)

Proof (Due to Euclid).

(1) If $f_1, \ldots, f_n$ were all irreducible monic polynomials, then we consider

$$g = f_1 \cdots f_n + 1 \in k[x].$$

So there is an irreducible monic polynomial $f = f_i$ dividing g for some i since

$$\deg g = \deg f_1 + \cdots + \deg f_n \geq 1$$

and $k[x]$ is a UFD.

(2) However, f would divide the difference

$$g - f_1 \cdots f_{i-1} f_i f_{i+1} \cdots f_n = 1,$$

contrary to $\deg f_i \geq 1$.

□

Problem 1.6.*

Show that any algebraically closed field is infinite. (Hint: The irreducible monic polynomials are $x - a$, $a \in k$.)

Proof (Due to Euclid).

(1) Let k be an algebraically closed field. If $a_1, \ldots, a_n$ were all elements in k, then we consider a monic polynomials

$$f(x) = (x - a_1) \cdots (x - a_n) + 1 \in k[x].$$

(2) Since k is algebraically closed, there is an element $a \in k$ such that $f(a) = 0$. By assumption, $a = a_i$ for some $1 \leq i \leq n$, and thus $f(a) = f(a_i) = 1$, contrary to the fact that a field is a commutative ring where $0 \neq 1$ and all nonzero elements are invertible.

□

Problem 1.7.*

Let k be a field, $f \in k[x_1, \ldots, x_n]$, $a_1, \ldots, a_n \in k$.

(a) *Show that*

$$f = \sum \lambda_{(i)} (x_1 - a_1)^{i_1} \cdots (x_n - a_n)^{i_n}, \qquad \lambda_{(i)} \in k.$$

(b) *If $f(a_1, \ldots, a_n) = 0$, show that $f = \sum_{i=1}^{n} (x_i - a_i) g_i$ for some (not unique) g_i in $k[x_1, \ldots, x_n]$.*

Proof of (a).

(1) Regard $k[x_1, \ldots, x_n]$ as $(k[x_1, \ldots, x_{n-1}])[x_n]$. Since $(k[x_1, \ldots, x_{n-1}])[x_n]$ is a Euclidean domain with a function

$$f \in (k[x_1, \ldots, x_{n-1}])[x_n] \mapsto \deg_{x_n} f \in \mathbb{Z}_{\geq 0}$$

satisfying the division-with-remainder property.

(2) Apply the division algorithm for f and nonzero $x_n - a_n$ to produce a quotient q and remainder r with $f = (x_n - a_n)q + r$ and either $r = 0$ or $\deg_{x_n}(r) < \deg_{x_n}(x_n - a_n) = 1$. That is, $r \in k[x_1, \ldots, x_{n-1}]$ is a constant in $(k[x_1, \ldots, x_{n-1}])[x_n]$. Continue this process to get that f is of the form

$$f = \sum_{i_n} f_{i_n} (x_n - a_n)^{i_n}$$

where $f_{i_n} \in k[x_1, \ldots, x_{n-1}]$.

(3) Use the same argument in (2) for each $f_{i_n} \in k[x_1, \ldots, x_{n-1}]$, we have

$$\begin{aligned}
f_{i_n} &= \sum_{i_{n-1}} \underbrace{f_{i_n, i_{n-1}}}_{\in k[x_1, \ldots, x_{n-2}]} (x_{n-1} - a_{n-1})^{i_{n-1}} \\
f_{i_n, i_{n-1}} &= \sum_{i_{n-2}} \underbrace{f_{i_n, i_{n-1}, i_{n-2}}}_{\in k[x_1, \ldots, x_{n-3}]} (x_{n-2} - a_{n-2})^{i_{n-2}}, \\
&\cdots \\
f_{i_n, \ldots, i_2} &= \sum_{i_1} \underbrace{f_{i_n, \ldots, i_1}}_{\in k} (x_1 - a_1)^{i_1}.
\end{aligned}$$

Note that $f_{i_n, \ldots, i_1} \in k$, we can write

$$f = \sum \lambda_{(i)} (x_1 - a_1)^{i_1} \cdots (x_n - a_n)^{i_n}, \qquad \lambda_{(i)} \in k.$$

by replacing all $f_{i_n, \ldots, i_k}$ by $f_{i_n, \ldots, i_{k-1}}$ for $k = n, n-1, \ldots, 2$.

(4) Or use the induction on n.

□

Proof of (b).

(1) Write
$$f = \sum \lambda_{(i)}(x_1 - a_1)^{i_1} \cdots (x_n - a_n)^{i_n}, \qquad \lambda_{(i)} \in k$$
by (a).

(2) As $f(a_1, \cdots, a_n) = 0$, $\lambda_{(i)} = 0$ if all $i_1, \ldots, i_n$ are zero, that it, there is no nonzero constant term in the representation of f. Hence, for each term
$$f_{(i)} := \lambda_{(i)}(x_1 - a_1)^{i_1} \cdots (x_n - a_n)^{i_n}$$
with $\lambda_{(i)} \neq 0$, there exists one $i_k > 0$ for some $1 \leq k \leq n$. So we can write
$$f_{(i)} = (x_k - a_k) \underbrace{(\lambda_{(i)}(x_1 - a_1)^{i_1} \cdots (x_k - a_k)^{i_k - 1} \cdots (x_n - a_n)^{i_n})}_{:= g_{(i)} \in k[x_1, \ldots, x_n]}.$$
Note that the expression of $f_{(i)}$ is not unique since there may exist more than one $i_k > 0$ as $1 \leq k \leq n$.

(3) Now we iterate each nonzero term in f, apply the factorization in (2), and then group by each $x_k - a_k$. Therefore, we can write
$$f = \sum_{i=1}^{n} (x_i - a_i) g_i$$
for some $g_1 \in k[x_1, \ldots, x_n]$.

(4) The expression of f is not unique. For example, take $f(x, y) = x^2 + 2xy + y^2 \in k[x, y]$. As $f(0, 0) = 0$, we can write
$$\begin{aligned} f(x, y) &= x \cdot \underbrace{(x + 2y)}_{g_1} + y \cdot \underbrace{y}_{g_2}, \text{ or} \\ &= x \cdot \underbrace{(x + y)}_{g_1} + y \cdot \underbrace{(x + y)}_{g_2}, \text{ or} \\ &= x \cdot \underbrace{x}_{g_1} + y \cdot \underbrace{(2x + y)}_{g_2}. \end{aligned}$$

□

1.2. Affine Space and Algebraic Sets

Problem 1.8.*

Show that the algebraic subsets of $\mathbf{A}^1(k)$ *are just the finite subsets, together with* $\mathbf{A}^1(k)$ *itself.*

Proof.

(1) *Show that* $k[x]$ *is a PID if* k *is a field.*

   (a) Let I be an ideal of $k[x]$.

   (b) If $I = \{0\}$ then $I = (0)$ and I is principal.

   (c) If $I \neq \{0\}$, then take f to be a polynomial of minimal degree in I. It suffices to show that $I = (f)$. Clearly, $(f) \subseteq I$ since I is an ideal. Conversely, for any $g \in I$,

$$g(x) = f(x)h(x) + r(x)$$

   for some $h, r \in k[x]$ with $r = 0$ or $\deg r < \deg f$ (as $k[x]$ is a Euclidean domain). Now as

$$r = g - fh \in I,$$

   $r = 0$ (otherwise contrary to the minimality of f), we have $g = fh \in (f)$ for all $g \in I$.

(2) Let Y be an algebraic subset of $\mathbf{A}^1(k)$, say $Y = V(I)$ for some ideal I of $k[x]$. Since $k[x]$ is a PID, $I = (f)$ for some $f \in k[x]$.

   (a) If $f = 0$, then $I = (0)$ and $Y = V(0) = \mathbf{A}^1(k)$.

   (b) If $f \neq 0$, then $f(x) = 0$ has finitely many roots in k, say $a_1, \ldots, a_m \in k$. Hence,

$$Y = V(I) = V(f) = \{f(a) = 0 : a \in k\} = \{a_1, \ldots, a_m\}$$

   is a finite subsets of $\mathbf{A}^1(k)$.

   By (a)(b), the result is established.

□

Notes.

(1) By the Hilbert basis theorem, $k[x]$ is Noetherian as k is Noetherian. Hence, for any algebraic subset $Y = V(I)$ of $\mathbf{A}^1(k)$, we can write $I = (f_1, \cdots, f_m)$. Note that

$$Y = V(I) = V(f_1) \cap \cdots \cap V(f_m).$$

   Now apply the same argument to get the same conclusion.

(2) Suppose $k = \overline{k}$. $\mathbf{A}^1(k)$ is irreducible, because its only proper closed subsets are finite, yet it is infinite (because k is algebraically closed, hence infinite).

Problem 1.9.

If k is a finite field, show that every subset of $\mathbf{A}^n(k)$ is algebraic.

Proof.

(1) Every subset of $\mathbf{A}^n(k)$ is finite since $|\mathbf{A}^n(k)| = |k|^n$ is finite.

(2) Note that $V(x_1 - a_1, \ldots, x_n - a_n) = \{(a_1, \ldots, a_n)\} \subseteq \mathbf{A}^n(k)$ (Property (5) in §1.2) and any finite union of algebraic sets is algebraic (Property (4) in §1.2). Thus, every subset of $\mathbf{A}^n(k)$ is algebraic (by (1)).

□

Problem 1.10.

Give an example of a countable collection of algebraic sets whose union is not algebraic.

Proof.

(1) Let $k = \mathbb{Q}$ be an infinite field. $V(x - a) = \{a\}$ is an algebraic sets for all $a \in \mathbb{Q}$. In particular, $V(x - a) = \{a\}$ is algebraic for all $a \in \mathbb{Z}$.

(2) Note that
$$Y := \bigcup_{a \in \mathbb{Z}} V(x - a) = \mathbb{Z}$$
is a countable union of algebraic sets. Since Y is a proper subset of $k = \mathbb{Q}$, it cannot be algebraic by Problem 1.8.

□

Problem 1.11.

Show that the following are algebraic sets:

(a) $\{(t, t^2, t^3) \in \mathbf{A}^3(k) : t \in k\}$;

(b) $\{(\cos(t), \sin(t)) \in \mathbf{A}^2(\mathbb{R}) : t \in \mathbb{R}\}$;

(c) *the set of points in* $\mathbf{A}^2(\mathbb{R})$ *whose polar coordinates* (r, θ) *satisfy the equation* $r = \sin(\theta)$.

Proof of (a).

(1) The twisted cubic curve

$$Y = \{(t, t^2, t^3) \in \mathbf{A}^3(k) : t \in k\} = V(x^2 - y) \cap V(x^3 - z)$$

is algebraic. We say that Y is given by the parametric representation $x = t$, $y = t^2$, $z = t^3$.

(2) The generators for the ideal $I(Y)$ are $x^2 - y$ and $x^3 - z$.

(3) Y is an affine variety of dimension 1.

(4) The affine coordinate ring $A(Y)$ is isomorphic to a polynomial ring in one variable over k.

□

Proof of (b). The circle

$$\{(\cos(t), \sin(t)) \in \mathbf{A}^2(\mathbb{R}) : t \in \mathbb{R}\} = V(x^2 - y^2 - 1)$$

is algebraic. □

Proof of (c). The circle

$$\{(r, \theta) : r = \sin(\theta)\} = V(x^2 + y^2 - y)$$

is algebraic again. □

Problem 1.12.

Suppose C is an affine plane curve, and L is a line in $\mathbf{A}^2(k)$, $L \not\subseteq C$. Suppose $C = V(f)$, $f \in k[x, y]$ a polynomial of degree n. Show that $L \cap C$ is a finite set of no more than n points. (Hint: Suppose $L = V(y - (ax + b))$, and consider $f(x, ax + b) \in k[x]$.)

Proof.

(1) Say $L = V(y - (ax + b))$ be a line in $\mathbf{A}^2(k)$. (The case $L = V(x - (ay + b))$ is similar.)

(2) Note that $L \not\subseteq C$ implies that $(y - (ax + b)) \nmid f$. Hence, the polynomial

$$g : x \mapsto f(x, ax + b) \in k[x]$$

is nonzero and $\deg g \leq n$. Therefore, the number of roots of g in k is no more than n.

(3) Hence,

$$\begin{aligned} L \cap C &= V(y-(ax+b)) \cap V(f) \\ &= \{(x,y) \in \mathbf{A}^2(k) : y = ax+b \text{ and } f(x,y) = 0\} \\ &= \{(x,y) \in \mathbf{A}^2(k) : f(x, ax+b) = 0\} \end{aligned}$$

is finite of no more than n points.

□

Problem 1.13.

Show that each of the following sets is not algebraic:

(a) $\{(x,y) \in \mathbf{A}^2(\mathbb{R}) : y = \sin(x)\}$.

(b) $\{(z,w) \in \mathbf{A}^2(\mathbb{C}) : |z|^2 + |w|^2 = 1\}$, *where* $|x+iy|^2 = x^2+y^2$ *for* $x, y \in \mathbb{R}$.

(c) $\{(\cos(t), \sin(t), t) \in \mathbf{A}^3(\mathbb{R}) : t \in \mathbb{R}\}$.

Proof of (a).

(1) (Reductio ad absurdum) If

$$Y := \{(x,y) \in \mathbf{A}^2(\mathbb{R}) : y = \sin(x)\}$$

were algebraic, then there is a subset S of $\mathbb{R}[x,y]$ such that

$$Y = V(S) = \bigcap_{f \in S} V(f).$$

(2) $S \neq \varnothing$ since $Y \neq \mathbf{A}^2(\mathbb{R})$. ($(89, 64) \in \mathbf{A}^2(\mathbb{R}) - Y$.)

(3) Take a fixed line $L = V(y)$ in $\mathbf{A}^2(\mathbb{R})$. For each affine curve $f \in S$, we have

$$V(f) \cap L \supseteq \bigcap_{f \in S} V(f) \cap L = Y \cap L = \{(n\pi, 0) \in \mathbf{A}^2(\mathbb{R}) : n \in \mathbb{Z}\},$$

which is infinite. By problem 1.12, $y \mid f$. As f runs over S, $Y \subseteq V(y) = L$, contradicts that $\left(0, \frac{\pi}{2}\right) \in L - Y$.

□

Proof of (b).

(1) Similar to (a). (Reductio ad absurdum) If

$$Y := \{(x, y) \in \mathbf{A}^2(\mathbb{C}) : |x|^2 + |y|^2 = 1\}$$

were algebraic, then there is a subset S of $\mathbb{C}[x, y]$ such that

$$Y = V(S) = \bigcap_{f \in S} V(f).$$

(2) $S \neq \varnothing$ since $Y \neq \mathbf{A}^2(\mathbb{C})$. ($(89, 64) \in \mathbf{A}^2(\mathbb{C}) - Y$.)

(3) Take a fixed line $L = V(x)$ in $\mathbf{A}^2(\mathbb{C})$. For each affine curve $f \in S$, we have

$$V(f) \cap L \supseteq \bigcap_{f \in S} V(f) \cap L = Y \cap L = \{(0, y) \in \mathbf{A}^2(\mathbb{C}) : |y| = 1\},$$

which is infinite (since Y contains a unit circle in the complex plane). By problem 1.12, $x \mid f$. As f runs over S, $Y \subseteq V(x) = L$, contradicts that the origin $(0, 0) \in L - Y$.

□

Proof of (c).

(1) Similar to (a) and (b).

(2) *Suppose C is an affine plane curve, and L is a line in $\mathbf{A}^3(k)$, $L \not\subseteq C$. Suppose $C = V(f)$, $f \in k[x, y, z]$ a polynomial of degree n. Show that $L \cap C$ is a finite set of no more than n points.* The proof is similar to Problem 1.12.

(a) Say $L = V(y - (ax + b), z - (cx + d))$ be a line in $\mathbf{A}^3(k)$.

(b) Note that $L \not\subseteq C$ implies that $(y - (ax + b)) \nmid f$ and $(z - (cx + d)) \nmid f$. Hence, the polynomial

$$g : x \mapsto f(x, ax + b, cx + d) \in k[x]$$

is nonzero and $\deg g \leq n$. Therefore, the number of roots of g in k is no more than n.

(c) Hence,

$$\begin{aligned} L \cap C &= V(y - (ax + b), z - (cx + d)) \cap V(f) \\ &= \{(x, y) \in \mathbf{A}^2(k) : y = ax + b, z = cx + d \text{ and } f(x, y) = 0\} \\ &= \{(x, y) \in \mathbf{A}^2(k) : f(x, ax + b, cx + d) = 0\} \end{aligned}$$

is finite of no more than n points.

(3) (Reductio ad absurdum) If

$$Y := \{(\cos(t), \sin(t), t) \in \mathbf{A}^3(\mathbb{R}) : t \in \mathbb{R}\}$$

were algebraic, then there is a subset S of $\mathbb{R}[x, y, z]$ such that

$$Y = V(S) = \bigcap_{f \in S} V(f).$$

(4) $S \neq \varnothing$ since $Y \neq \mathbf{A}^3(\mathbb{R})$. $((1989, 6, 4) \in \mathbf{A}^3(\mathbb{R}) - Y.)$

(5) Take a fixed line $L = V(x - 1, y)$ in $\mathbf{A}^3(\mathbb{R})$. For each affine curve $f \in S$, we have

$$V(f) \cap L \supseteq \bigcap_{f \in S} V(f) \cap L = Y \cap L = \{(1, 0, 2n\pi) \in \mathbf{A}^3(\mathbb{R}) : n \in \mathbb{Z}\},$$

which is infinite. By (2), $(x - 1) \mid f$ and $y \mid f$. As f runs over S, $Y \subseteq V(x - 1, y) = L$, contradicts that $(1, 0, \pi) \in L - Y$.

□

Supplement. *A circular disk of radius* 1 *in the plane xy rolls without slipping along the x axis. The figure described by a point of the circumference of of the disk is called a* ***cycloid****. The parametrized curve* $\alpha : \mathbb{R} \to \mathbb{R}^2$ *is*

$$\begin{cases} x = t - \sin t \\ y = 1 - \cos t. \end{cases}$$

The cycloid is not algebraic (as (a)).

Problem 1.14.*

Let f be a nonconstant polynomial in $k[x_1, \ldots, x_n]$, k algebraically closed. Show that $\mathbf{A}^n(k) - V(f)$ is infinite if $n \geq 1$, and $V(f)$ is infinite if $n \geq 2$. Conclude that the complement of any proper algebraic set is infinite. (Hint: See Problem 1.4.)

Proof.

(1) *Show that $\mathbf{A}^n(k) - V(f)$ is infinite if $n \geq 1$.* Since f is a nonconstant polynomial in $k[x_1, \ldots, x_n]$, we may assume that $\deg_{x_n}(f) > 0$. Hence

$$x_n \mapsto f(1, \ldots, 1, x_n)$$

is a nonconstant polynomial of degree $\deg_{x_n}(f) > 0$ in $k[x_n]$. So f has finitely many roots in k, say $\xi_1, \ldots, \xi_m$ $(m \geq 0)$. Hence,

$$(1, \ldots, 1, x_n) \neq 0$$

whenever $x_n \neq \xi_m$. Such subset in $\mathbf{A}^1(k)$ is infinite since $k = \overline{k}$ (Problem 1.6). Therefore,

$$\begin{aligned}\mathbf{A}^n(k) - V(f) &= \{(a_1, \ldots, a_n) \in \mathbf{A}^n(k) : f(a_1, \ldots, a_n) \neq 0\} \\ &\supseteq \{a_n \in \mathbf{A}^1(k) : f(1, \ldots, 1, x_n) \neq 0\}\end{aligned}$$

is infinite.

(2) *Show that $V(f)$ is infinite if $n \geq 2$.*

(a) Similar to (1). Since f is a nonconstant polynomial in $k[x_1, \ldots, x_n]$, we may assume that $m := \deg_{x_n}(f) > 0$. Write

$$f = \sum_{i=0}^{m} f_i(x_1, \ldots, x_{n-1}) x_n^i.$$

Note that each f_i is well-defined since $n \geq 2$.

(b) If f_n is constant in $k[x_1, \ldots, x_{n-1}]$, then f_n is nonzero (since $m > 0$) or $V(f_n) = \varnothing$. If f_n is nonconstant in $k[x_1, \ldots, x_{n-1}]$, then the set $\mathbf{A}^{n-1}(k) - V(f_n)$ is infinite by (1). In any case,

$$\mathbf{A}^{n-1}(k) - V(f_n)$$

is infinite.

(c) For each $P = (a_1, \ldots, a_{n-1}) \in \mathbf{A}^{n-1}(k) - V(f_n)$,

$$g_P : x_n \mapsto f(P, x_n) = f(a_1, \ldots, a_{n-1}, x_n)$$

defines a polynomial in $k[x_n]$ of degree $m > 0$. Since $k = \overline{k}$, g_P has at least one root $Q \in k$. Hence

$$V(f) \supseteq \{(P, Q) \in \mathbf{A}^n(k) : P \in \mathbf{A}^{n-1}(k) - V(f_n), g_P(Q) = 0\}$$

is infinite since the set $\mathbf{A}^{n-1}(k) - V(f_n)$ is infinite.

Note. It is not true if $k \neq \overline{k}$. For example, $V(x^2 + y^2 + 1) = \varnothing$ in $\mathbf{A}^2(\mathbb{R})$.

(3) Note that

$$\mathbf{A}^n(k) - V(S) = \mathbf{A}^n(k) - \bigcap_{f \in S} V(f) = \bigcup_{f \in S} (\mathbf{A}^n(k) - V(f)).$$

Thus the complement of any proper algebraic set is infinite by (1).

□

Problem 1.15.*

Let $V \subseteq \mathbf{A}^n(k)$, $W \subseteq \mathbf{A}^m(k)$ be algebraic sets. Show that

$$V \times W = \{(a_1, \ldots, a_n, b_1, \ldots, b_m) : (a_1, \ldots, a_n) \in V, (b_1, \ldots, b_m) \in W\}$$

*is an algebraic set in $\mathbf{A}^{n+m}(k)$. It is called the **product** of V and W.*

Proof.

(1) Write

$$V = V(S_V) = \{P \in \mathbf{A}^n(k) : f(P) = 0 \, \forall f \in S_V\}$$
$$W = V(S_W) = \{Q \in \mathbf{A}^m(k) : g(Q) = 0 \, \forall g \in S_W\},$$

where $S_V \subseteq k[x_1, \ldots, x_n]$ and $S_W \subseteq k[y_1, \ldots, y_m]$. It suffices to show that

$$V \times W = V(S),$$

where $S \subseteq k[x_1, \ldots, x_n, y_1, \ldots, y_m]$ is the union of S_V and S_W.

(2) Here we can identify S_V with the subset of $k[x_1, \ldots, x_n, y_1, \ldots, y_m]$ by noting that

$$k[x_1, \ldots, x_n] \hookrightarrow (k[y_1, \ldots, y_m])[x_1, \ldots, x_n] = k[x_1, \ldots, x_n, y_1, \ldots, y_m].$$

Here we regard k as a subring of $k[y_1, \ldots, y_m]$. Similar treatment to S_W.

(3) By construction, $V \times W \subseteq V(S)$. Conversely, given any $(P, Q) \in V(S) \subseteq \mathbf{A}^{n+m}(k)$, we have $h(P, Q) = 0$ for all $h \in S = S_V \cup S_W$ (by (2)). By construction, $f(P) = 0$ for all $f \in S_V$ since f only involve $x_1, \ldots, x_n$. Hence, $P \in V$. Similarly, $Q \in W$. Therefore, $(P, Q) \in V \times W$.

□

1.3. The Ideal of a Set of Points

Problem 1.16.*

Let V, W be algebraic sets in $\mathbf{A}^n(k)$. Show that $V = W$ if and only if $I(V) = I(W)$.

Proof.

(1) (Proof of Property (6) in §1.3.) *Show that if $X \subseteq Y$, then $I(X) \supseteq I(Y)$.* If $f \in I(Y)$ then $f(P) = 0$ for all $P \in Y$. So $f(P) = 0$ for all $P \in X \subseteq Y$ or $f \in I(X)$.

(2) (Proof of Property (8) in §1.3.) *$I(V(S)) \supseteq S$ for any set S of polynomials; $V(I(X)) \supseteq X$ for any set X of points.*

   (a) If $f \in S$ then f vanishes on $V(S)$, hence $f \in IV(S)$.

   (b) If $P \in X$ then every polynomial in $I(X)$ vanishes at P, so P belongs to the zero set of $I(X)$.

(3) (Proof of Property (9) in §1.3.) *$V(I(V(S))) = V(S)$ for any set S of polynomials, and $I(V(I(X))) = I(X)$ for any set X of points. So if V is an algebraic set, $V = V(I(V))$, and if I is the ideal of an algebraic set, $I = I(V(I))$.*

   (a) In each case, it suffices to show that the left side is a subset of the right side. (by Properties (6)(8) in §1.3).

   (b) If $P \in V(S)$ then $f(P) = 0$ for all $f \in I(V(S))$, so $P \in V(I(V(S)))$.

   (c) If $f \in I(X)$ then $f(P) = 0$ for all $P \in V(I(X))$. Thus f vanishes on $V(I(X))$, so $f \in I(V(I(X)))$.

(4) *Show that $V = W$ if and only if $I(V) = I(W)$.*

   (a) By Property (6) in §1.3, $I(V) \supseteq I(W)$ if $V \subseteq W$ and $I(V) \subseteq I(W)$ if $V \supseteq W$. Thus, $I(V) = I(W)$ if $V = W$.

   (b) Conversely, $I(V) = I(W)$ implies that $V(I(V)) = V(I(W))$ by Property (3) in §1.2 and similar argument in (a). By Property (9) in §1.3, $V(I(V)) = V$ and $V(I(W)) = W$. Thus, $V = W$.

□

Problem 1.17.*

(a) *Let V be an algebraic set in $\mathbf{A}^n(k)$, $P \in \mathbf{A}^n(k)$ a point not in V. Show that there is a polynomial $f \in k[x_1, \ldots, x_n]$ such that $f(Q) = 0$ for all $Q \in V$, but $f(P) = 1$. (Hint: $I(V) \neq I(V \cup \{P\})$.)*

(b) *Let $P_1, \ldots, P_r$ be distinct points in $\mathbf{A}^n(k)$, not in an algebraic set V. Show that there are polynomials $f_1, \ldots, f_r \in I(V)$ such that $f_i(P_j) = 0$ if $i \neq j$, and $f_i(P_i) = 1$. (Hint: Apply (a) to the union of V and all but one point.)*

(c) *With $P_1, \ldots, P_r$ and V as in (b), and $a_{ij} \in k$ for $1 \leq i, j \leq r$, show that there are $g_i \in I(V)$ with $g_i(P_j) = a_{ij}$ for all i and j. (Hint: Consider $\sum_j a_{ij} f_j$.)*

Proof of (a).

(1) Since $I(V) \supsetneq I(V \cup \{P\})$ (by Problem 1.16), there is a polynomial $f \in k[x_1, \ldots, x_n]$ such that $f(Q) = 0$ for all $Q \in V$, but $f(P) \neq 0$.

(2) Since k is a field, $(f(P))^{-1} \in k$. Consider the polynomial $(f(P))^{-1}f \in k[x_1, \ldots, x_n]$. It is well-defined. Also, $((f(P))^{-1}f)(Q) = (f(P))^{-1}f(Q) = 0$ for all $Q \in V$, but $(f(P))^{-1}f)(P) = (f(P))^{-1}f(P) = 1$.

□

Proof of (b).

(1) For $1 \leq i \leq$, define

$$W = V \cup \{P_1, \ldots, P_r\}$$
$$W_i = V \cup \{P_1, \ldots, \widehat{P_i}, \ldots, P_r\}.$$

Here $W = W_i \cup \{P_i\} \neq W_i$.

(2) By (a), there is a polynomial $f_i \in k[x_1, \ldots, x_n]$ such that $f_i(Q) = 0$ for all $Q \in W_i$, but $f_i(P_i) = 1$. Here $f_i \in I(V)$ and $f_i(P_j) = \delta_{ij}$ where δ_{ij} is the Kronecker delta.

□

Proof of (c).

(1) For each $1 \leq i \leq r$, define

$$g_i = \sum_j a_{ij} f_j \in k[x_1, \ldots, x_n].$$

(2) $g_i \in I(V)$ since g_i is a linear combination of f_j and $I(V)$ is an ideal.

(3) Also,

$$g_i(P_j) = \sum_{j'} a_{ij'} f_{j'}(P_j) = \sum_{j'} a_{ij'} \delta_{j'j} = a_{ij}.$$

□

Problem 1.18.*

Let I be an ideal in a ring R. If $a^n \in I$, $b^m \in I$, show that $(a+b)^{n+m} \in I$. Show that $\mathrm{rad}(I)$ *is an ideal, in fact a radical ideal. Show that any prime ideal is radical.*

Proof.

(1) *Show that* $(a+b)^{n+m} \in I$ *if* $a^n \in I$, $b^m \in I$. By the binomial theorem,

$$(a+b)^{n+m} = \sum_{i=0}^{n+m} a^i b^{n+m-i}.$$

For each term $a^i b^{n+m-i}$, either $i \geq n$ holds or $n+m-i \geq m$ holds, and thus $a^i b^{n+m-i} \in I$ (since $a^n \in I$, $b^m \in I$ and I is an ideal). Hence, the result is established.

(2) *Show that* $\mathrm{rad}(I)$ *is an ideal.*

(a) $0 \in \mathrm{rad}(I)$ since $0 = 0^1 \in I$ for any ideal in R.

(b) $(a+b)^{n+m} \in I$ if $a^n \in I$, $b^m \in I$ by (1).

(c) $(-a)^{2n} = (a^n)^2 \in I$ if $a^n \in I$ (since I is an ideal).

(d) $(ra)^n = r^n a^n \in I$ if $a^n \in I$ and $r \in R$ (since I is an ideal and R is commutative).

(3) *Show that* $\mathrm{rad}(\mathrm{rad}(I)) = \mathrm{rad}(I)$. It suffices to show $\mathrm{rad}(\mathrm{rad}(I)) \subseteq \mathrm{rad}(I)$. Given any $a \in \mathrm{rad}(\mathrm{rad}(I))$. By definition $a^n \in \mathrm{rad}(I)$ for some positive integer n. Again by definition $(a^n)^m = a^{nm} \in I$ for some positive integer m. As nm is a postive integer, $a \in \mathrm{rad}(I)$.

(4) *Show that every prime ideal* $\mathfrak{p}$ *is radical.* Given any $a \in \mathrm{rad}(\mathfrak{p})$, that is, $a^n \in \mathfrak{p}$ for some positive integer. Write $a^n = aa^{n-1}$ if $n > 1$. By the primality of $\mathfrak{p}$, $a \in \mathfrak{p}$ or $a^{n-1} \in \mathfrak{p}$. If $a \in \mathfrak{p}$, we are done. If $a^{n-1} \in \mathfrak{p}$, we continue this descending argument (or the mathematical induction) until the power of a is equal to 1. Hence $\mathfrak{p}$ is radical.

□

Problem 1.19.

Show that $I = (x^2+1) \subseteq \mathbb{R}[x]$ *is a radical (even a prime) ideal, but* I *is not the ideal of any set in* $\mathbf{A}^1(\mathbb{R})$.

Proof.

(1) *Show that* $I = (x^2+1)$ *is a prime ideal in* $\mathbb{R}[x]$. Given any $fg \in I$. It suffices to show that $f \in I$ or $g \in I$. By definition of I, there is a polynomial $h \in \mathbb{R}[x]$ such that $fg = (x^2+1)h$. So $(x^2+1) \mid f$ or $(x^2+1) \mid g$ since x^2+1 is irreducible in a unique factorization domain $\mathbb{R}[x]$. Therefore, $f \in I$ or $g \in I$.

(2) *Show that* I *is not the ideal of any set in* $\mathbf{A}^1(\mathbb{R})$. Since x^2+1 has no roots in $\mathbb{R}$, I cannot be the ideal of any nonempty set in $\mathbf{A}^1(\mathbb{R})$. Besides, $I(\varnothing) = (1) \neq (x^2+1)$.

□

Problem 1.20.*

Show that for any ideal I in $k[x_1, \ldots, x_n]$, $V(I) = V(\mathrm{rad}(I))$, and $\mathrm{rad}(I) \subseteq I(V(I))$.

Proof.

(1) *Show that $V(I) = V(\mathrm{rad}(I))$.* Since $I \subseteq \mathrm{rad}(I)$, it suffices to show that $V(I) \subseteq V(\mathrm{rad}(I))$. Given any $P \in V(I)$. For any $f \in \mathrm{rad}(I)$, $f^n \in I$ for some positive integer $n > 0$. Note that

$$0 = (f^n)(P) = f(P)^n$$

since $f^n \in I$ and $P \in V(I)$. As k is a domain, $f(P)^n = 0$ implies $f(P) = 0$. So $P \in V(\mathrm{rad}(I))$.

(2) By Properties (6)(8) in §1.3,

$$I(V(I)) = I(V(\mathrm{rad}(I))) \supseteq \mathrm{rad}(I).$$

□

Note.

(1) By the Hilbert's Nullstellensatz, $I(V(I)) = \mathrm{rad}(I)$ if $k = \overline{k}$.

(2) Take $I = (x^2 + 1)$ as an ideal in $\mathbb{R}[x]$. Note that $I(V(I)) = I(\varnothing) = (1)$ and $\mathrm{rad}(I) = I = (x^2 + 1)$. So the equality in $\mathrm{rad}(I) \subsetneq I(V(I))$ might not hold if $k \neq \overline{k}$. (See Problem 1.19.)

Problem 1.21.*

Show that $I = (x_1 - a_1, \ldots, x_n - a_n) \subseteq k[x_1, \ldots, x_n]$ is a maximal ideal, and that the natural homomorphism from k to $k[x_1, \ldots, x_n]/I$ is an isomorphism.

Proof.

(1) *Show that I is a maximal ideal.* Suppose that J is an ideal such that $J \supsetneq I$. Take any $f \in J - I$. By Problem 1.7(a),

$$f = \sum \lambda_{(i)} (x_1 - a_1)^{i_1} \cdots (x_n - a_n)^{i_n}.$$

As $f \notin I$, there is a nonzero constant term in f, say $\lambda \in k - \{0\}$. Note that $f - \lambda \in I \subsetneq J$. Hence,

$$\lambda = f - (f - \lambda) \in J$$

since J is an ideal. As $\lambda \neq 0$, $J = k[x_1, \ldots, x_n]$ is not a proper ideal containing I.

(2) Let $\varphi : k \to k[x_1, \ldots, x_n]/I$ be the natural homomorphism. (That is, $\varphi : \lambda \to \lambda + I \in k[x_1, \ldots, x_n]/I$.)

(3) *Show that φ is surjective.* Given any $f + I \in k[x_1, \ldots, x_n]/I$. By Problem 1.7(a),

$$f = \sum \lambda_{(i)} (x_1 - a_1)^{i_1} \cdots (x_n - a_n)^{i_n}.$$

So

$$\begin{aligned} f + I &= \sum \lambda_{(i)} (x_1 - a_1)^{i_1} \cdots (x_n - a_n)^{i_n} + I \\ &= \left(f(a_1, \ldots, a_n) + \sum_{\text{nonconstant}} \lambda_{(i)} (x_1 - a_1)^{i_1} \cdots (x_n - a_n)^{i_n} \right) + I \\ &= f(a_1, \ldots, a_n) + I. \end{aligned}$$

(Here the summation over all nonconstant terms is in I.) Hence

$$\varphi : f(a_1, \ldots, a_n) \in k \mapsto f + I.$$

(4) *Show that φ is injective.* $\ker(\varphi) = \{\lambda \in k : \lambda \in I\} = k \cap I = \{0\}$ since I is a proper ideal.

(5) By (2)(3)(4), $\varphi : k \to k[x_1, \ldots, x_n]/(x_1 - a_1, \ldots, x_n - a_n)$ is an isomorphism.

□

1.4. The Hilbert Basis Theorem

Problem 1.22.* (Correspondence theorem for rings)

Let I be an ideal in a ring R, $\pi : R \to R/I$ the natural homomorphism.

(a) *Show that for every ideal J' of R/I, $\pi^{-1}(J') = J$ is an ideal of R containing I, and for every ideal J of R containing I, $\pi(J) = J'$ is an ideal of R/I. This sets up a natural one-to-one correspondence between $\{$ideals of $R/I\}$ and $\{$ideals of R that contain $I\}$.*

(b) *Show that J' is a radical ideal if and only if J is radical. Similarly for prime and maximal ideals.*

(c) *Show that J' is finitely generated if J is. Conclude that R/I is Noetherian if R is Noetherian. Any ring of the form $k[x_1, \ldots, x_n]/I$ is Noetherian.*

Proof of (a).

(1) *Show that for every ideal J' of R/I, $\pi^{-1}(J') = J$ is an ideal of R containing I.*

   (a) *Show that J contains I.* Note that $\pi^{-1}(0) = I \subseteq \pi^{-1}(J') = J$. So J contains I. In particular, $J \neq \varnothing$ since $I \neq \varnothing$.

   (b) *Show that J is a additive subgroup of R.* It suffices to show that $a - b \in J$ for any $a \in J$ and $b \in J$. Actually,

$$\pi(a - b) = \pi(a) - \pi(b) \in J'$$

   implies $a - b \in \pi^{-1}(J') = J$.

   (c) *Show that for every $r \in R$ and every $a \in J$, the product $ra \in J$.* In fact,

$$\pi(ra) = \pi(r)\pi(a) \in J'$$

   implies $ra \in \pi^{-1}(J') = J$.

(2) *Show that for every ideal J of R containing I, $\pi(J) = J'$ is an ideal of R/I.*

   (a) *Show that J' is nonempty.* Note that $\pi(a) = 0 \in \pi(I) \subseteq \pi(J) = J'$ for any $a \in I$. So J' is nonempty since J is nonempty.

   (b) *Show that J' is a additive subgroup of R/I.* It suffices to show that $\pi(a) - \pi(b) \in J'$ for any $\pi(a) \in J'$, $\pi(b) \in J'$, $a \in J$ and $b \in J$. It is trivial since

$$\pi(a) - \pi(b) = \pi(a - b) \in \pi(J) = J',$$

   π is a ring homomorphism and J is an ideal.

   (c) *Show that for every $\pi(r) \in R/I$ ($r \in R$) and every $\pi(a) \in J'$ ($a \in J$), the product $\pi(r)\pi(a) \in J'$.* It is trivial since

$$\pi(r)\pi(a) = \pi(ra) \in \pi(J) = J',$$

   π is a ring homomorphism and J is an ideal.

(3) By (1)(2), we setup the correspondence between

$$\{\text{ideals of } R/I\} \longleftrightarrow \{\text{ideals of } R \text{ that contain } I\}.$$

   Note that this correspondence preserves the subset relation, and thus this correspondence is one-to-one.

□

Proof of (b).

(1) *Show that J' is radical if J is radical.* It suffices to show that $(a+I)^n = a^n + I \in J'$ implies that $a + I \in J'$. Note that

$$(a+I)^n = a^n + I \in J'$$

implies that $a^n \in J$ or $a \in J$ since J is radical. Hence $a + I \in J/I = J'$.

(2) *Show that J is radical if J' is radical.* It suffices to show that $a^n \in J$ implies that $a \in J$. Note that

$$\pi(a^n) = \pi(a)^n \in J'$$

implies that $\pi(a) \in J'$ since J' is radical. $a \in \pi^{-1}(J') = J$.

(3) *Show that J' is prime if J is prime.* It suffices to show that $(a+I)(b+I) = ab + I \in J'$ implies that $a + I \in J'$ or $b + I \in J'$. Note that

$$(a+I)(b+I) = ab + I \in J'$$

implies that $ab \in J$. So $a \in J$ or $b \in J$ by the primality of J. Hence $a + I \in J'$ or $b + I \in J'$.

(4) *Show that J is prime if J' is prime.* It suffices to show that $ab \in J$ implies that $a \in J$ or $b \in J$. Note that

$$\pi(ab) = \pi(a)\pi(b) \in J'$$

implies that $\pi(a) \in J'$ or $\pi(b) \in J'$ by the primality of J'. So $a \in \pi^{-1}(J') = J$ or $b \in \pi^{-1}(J') = J$.

(5) *Show that J' is maximal if J is maximal.* Suppose $\mathfrak{m}$ is an ideal containing J'. By (a), $\pi^{-1}(\mathfrak{m})$ is an ideal containing J. So $\pi^{-1}(\mathfrak{m}) = J$ or $\pi^{-1}(\mathfrak{m}) = R$ by the maximality of J. Hence, $\mathfrak{m} = \pi(J) = J'$ or $\mathfrak{m} = \pi(R) = R/I$.

(6) *Show that J is maximal if J' is maximal.* Suppose $\mathfrak{m}$ is an ideal containing J. By (a), $\pi(\mathfrak{m})$ is an ideal containing J'. So $\pi(\mathfrak{m}) = J'$ or $\pi(\mathfrak{m}) = R/I$ by the maximality of J'. Hence, $\mathfrak{m} = \pi^{-1}(J') = J$ or $\mathfrak{m} = \pi^{-1}(R/I) = R$.

□

Note.

(1) Note that

$$R/J \cong (R/I)/(J/I)$$

if J is an ideal of R such that $I \subseteq J$.

(2) Hence, J is prime iff $R/J \cong (R/I)/(J/I)$ is a domain iff J/I is prime.

(3) Also, J is maximal iff $R/J \cong (R/I)/(J/I)$ is a field iff J/I is maximal.

Proof of (c).

(1) *Show that J' is finitely generated if J is.* Suppose J is generated by $a_1, \ldots, a_m$. It suffices to show that J' is generated by

$$a_1 + I, \ldots, a_m + I \in J/I.$$

Given any $a + I \in J'$ where $a \in J$. Write $a = \sum_{1 \leq i \leq m} r_i a_i$ for some $r_i \in R$. Then

$$a + I = \sum r_i a_i + I = \sum (r_i + I)(a_i + I)$$

is generated by $a_1 + I, \ldots, a_m + I$.

(2) *Show that that R/I is Noetherian if R is Noetherian.* Note that R is an ideal of itself.

(3) *Show that any ring of the form $k[x_1, \ldots, x_n]/I$ is Noetherian.* By the corollary to the Hilbert basis theorem, $k[x_1, \ldots, x_n]$ is Noetherian. By (2), the ring $k[x_1, \ldots, x_n]/I$ is Noetherian.

□

1.5. Irreducible Components of an Algebraic Set

Problem 1.23.

Give an example of a collection of ideals $\mathscr{S}$ ideals in a Noetherian ring such that no maximal member of $\mathscr{S}$ is a maximal ideal.

Proof.

(1) Let R be any Noetherian ring. Let $\mathscr{S}$ be any collection of ideals containing R itself. Then the only maximal member of $\mathscr{S}$ is R, which is not a maximal ideal.

(2) Or let R be any Noetherian ring and R is not a field. ($R = k[x_1, \ldots, k_n]$ where k is a field for example.) Let $\mathscr{S} = \{(0)\}$. Then the only maximal member of $\mathscr{S}$ is (0), which is not maximal since R is not a field.

□

Problem 1.24.

Show that every proper ideal in a Noetherian ring is contained in a maximal ideal. (Hint: If I is the ideal, apply the lemma to $\{$proper ideals that contain $I\}$.)

Proof.

(1) Say I be any proper ideal in a Noetherian ring. Let

$$\mathscr{S} = \{\text{proper ideals that contain } I\}.$$

Apply the lemma to $\mathscr{S}$ to get that $\mathscr{S}$ has a maximal member $\mathfrak{m} \in \mathscr{S}$.

(2) *Show that $\mathfrak{m}$ is maximal.* Since $\mathfrak{m} \in \mathscr{S}$, $\mathfrak{m}$ is a proper ideal in R. Suppose $\mathfrak{m}' \supseteq \mathfrak{m}$ is a proper ideal containing $\mathfrak{m}$. As $\mathfrak{m}$ contains I, $\mathfrak{m}'$ also contains I or $\mathfrak{m}' \in \mathscr{S}$. By the maximality of $\mathfrak{m}$, $\mathfrak{m}' \subseteq \mathfrak{m}$. So $\mathfrak{m}' = \mathfrak{m}$.

□

Problem 1.25.

(a) *Show that $V(y - x^2) \subseteq \mathbf{A}^2(\mathbb{C})$ is irreducible, in fact, $I(V(y - x^2)) = (y - x^2)$.*

(b) *Decompose $V(y^4 - x^2, y^4 - x^2y^2 + xy^2 - x^3) \subseteq \mathbf{A}^2(\mathbb{C})$ into irreducible components.*

Proof of (a).

(1) Let $I = (y - x^2)$ be an ideal of $\mathbb{C}[x, y]$. Since $\mathbb{C}$ is algebraically closed,

$$I(V(I)) = \operatorname{rad}(I)$$

by the Hilbert's Nullstellensatz. It suffices to show that I is prime, or to show that $y - x^2$ is prime. Since $\mathbb{C}[x, y]$ is a UFD, it suffices to show that $y - x^2$ is irreducible.

(2) *Show that $y - x^2$ is irreducible in $\mathbb{C}[x, y]$.* Write

$$y - x^2 \in (\mathbb{C}[y])[x].$$

Note that $\mathbb{C}[y]$ is a UFD and y is the constant term. If we can show that y is prime in $\mathbb{C}[y]$, then by the Eisenstein's criterion we can say $y - x^2$ is irreducible in $(\mathbb{C}[y])[x]$.

(3) As $\mathbb{C}[y]/(y) \cong \mathbb{C}$ is a field or a domain, (y) is maximal or prime. Hence, $y - x^2$ is irreducible.

(4) Or apply Corollary 1 to Proposition 2 in the next section to (2)(3).

□

Proof of (b).

(1) Write

$$\begin{aligned} Y &:= V(y^4 - x^2, y^4 - x^2y^2 + xy^2 - x^3) \\ &= V((y^2 - x)(y^2 + x), (y^2 - x^2)(y^2 + x)) \\ &= V(y^2 + x) \cup V(y^2 - x, y^2 - x^2) \\ &= V(y^2 + x) \cup V(y^2 - x, x(x - 1)) \\ &= V(y^2 + x) \cup V(x, y) \cup V(y + 1, x - 1) \cup V(y - 1, x - 1). \end{aligned}$$

(2) Here $V(y^2 + x)$ is irreducible as (a). Besides, $V(x, y)$, $V(y + 1, x - 1)$ and $V(y - 1, x - 1)$ are irreducible since all corresponding ideals are maximal (by the Hilbert's Nullstellensatz and Problem 1.21).

□

Problem 1.26.

Show that $f = y^2 + x^2(x - 1)^2 \in \mathbb{R}[x, y]$ is an irreducible polynomial, but $V(f)$ is reducible.

Proof.

(1) *Show that f is an irreducible polynomial.*

(a) Suppose

$$f = (f_2(x)y^2 + f_1(x)y + f_0(x)) \cdot g(x)$$

for some $f_i(x), g(x) \in \mathbb{R}[x]$. So

$$f_2(x)g(x) = 1, \qquad f_1(x)g(x) = 0, \qquad f_0(x)g(x) = x^2(x - 1)^2.$$

Hence,

$$f_2(x)y^2 + f_1(x)y + f_0(x) = uf, \qquad g(x) = u^{-1},$$

where u is a unit in $\mathbb{R}$.

(b) Suppose

$$f = (f_1(x)y + f_0(x)) \cdot (g_1(x)y + g_0(x))$$

for some $f_i(x), g_j(x) \in \mathbb{R}[x]$. So

$$\begin{aligned} f_1(x)g_1(x) &= 1, \\ f_1(x)g_0(x) + f_0(x)g_1(x) &= 0, \\ f_0(x)g_0(x) &= x^2(x-1)^2. \end{aligned}$$

So $f_1(x) = u$, $g_1(x) = u^{-1}$ for some unit $u \in \mathbb{R}$. Hence,

$$u^2 g_0(x)^2 = -x^2(x-1)^2,$$

which is absurd since $\mathbb{R}$ is not algebraically closed.

(c) By (a)(b), f is irreducible in $\mathbb{R}[x, y]$.

(2) *Show that $V(f)$ is reducible.* $V(f) = \{(0,0), (1,0)\} = V(x, y) \cup V(x-1, y)$. Here $V(x, y)$ and $V(x-1, y)$ are all proper algebraic sets in $V(f)$.

□

Problem 1.27.

Let V, W be algebraic sets in $\mathbf{A}^n(k)$ with $V \subseteq W$. Show that each irreducible component of V is contained in some irreducible component of W.

Proof.

(1) Write two decompositions of V, W into irreducible components as

$$\begin{aligned} V &= V_1 \cup \cdots \cup V_r, \\ W &= W_1 \cup \cdots \cup W_s, \end{aligned}$$

(2) For each irreducible component V_i of V, consider $V_i \cap W$:

$$V_i \cap W = (V_i \cap W_1) \cup \cdots \cup (V_i \cap W_s).$$

By the irreducibility of V_i, there is only one j such that $V_i \cap W_j = V_i$ and other intersections are empty. Therefore, each irreducible component V_i is contained in some irreducible component W_j of W.

□

Problem 1.28.

If $V = V_1 \cup \cdots \cup V_r$ is the decomposition of an algebraic set into irreducible components, show that $V_i \not\subseteq \bigcup_{j \neq i} V_j$.

Proof.

(1) (Reductio ad absurdum) If

$$V_i \subseteq \bigcup_{j \neq i} V_j$$

for some i, then

$$V = V_1 \cup \cdots \cup \widehat{V_i} \cup \cdots \cup V_r$$

is another decomposition of an algebraic set into irreducible components.

(2) By Theorem 2 in §1.5, the number of irreducible components is unique determined, contrary to the assumption and (1).

□

Problem 1.29.*

Show that $\mathbf{A}^n(k)$ is irreducible if k is infinite.

Proof.

(1) (Reductio ad absurdum) If $\mathbf{A}^n(k)$ were reducible, then $\mathbf{A}^n(k) = V_1 \cup V_2$ where V_1, V_2 are algebraic sets in $\mathbf{A}^n(k)$, V_1 and V_2 are nonempty and proper in $\mathbf{A}^n(k)$.

(2) Take $P_i \in V_i$ for $i = 1, 2$. By Problem 1.17, there are two polynomials $f_1, f_2 \in k[x_1, \ldots, x_n]$ such that $f_i(Q) = 0$ for all $Q \in V_i$ and $f_1(P_2) = f_2(P_1) = 1$.

(3) By construction, $(f_1 f_2)(a_1, \ldots, a_n) = 0$ for any $a_1, \ldots, a_n \in k$. As k is infinite, $f_1 f_2 = 0$ by Problem 1.4. Since $k[x_1, \ldots, x_n]$ is a domain, $f_1 = 0$ or $f_2 = 0$, contrary to $f_1(P_2) = f_2(P_1) \neq 0$.

□

Note. $\mathbf{A}^n(k)$ is reducible if k is finite.

1.6. Algebraic Subsets of the Plane

Problem 1.30.

Let $k = \mathbb{R}$.

(a) *Show that $I(V(x^2 + y^2 + 1)) = (1)$.*

(b) *Show that every algebraic subset of $\mathbf{A}^2(\mathbb{R})$ is equal to $V(f)$ for some $f \in \mathbb{R}[x, y]$.*

This indicates why we usually require that k be algebraically closed.

Proof of (a). $I(V(x^2 + y^2 + 1)) = I(\varnothing) = (1)$ since $x^2 + y^2 + 1 \geq 1$ is never zero for any $x, y \in \mathbb{R}$. □

Proof of (b).

(1) Given any algebraic subset V of $\mathbf{A}^2(\mathbb{R})$. $V = V(1)$ if $V = \varnothing$. $V = V(0)$ if $V = \mathbf{A}^2(\mathbb{R})$. Now suppose V is a nonempty proper algebraic subset V of $\mathbf{A}^2(\mathbb{R})$. Write $V = V_1 \cup \cdots \cup V_m$, where each V_i is irreducible. Here $V_i \neq \varnothing$ and $V_i \neq \mathbf{A}^2(\mathbb{R})$ for all i.

(2) As $k = \mathbb{R}$ is infinite, Corollary 2 to Proposition 2 implies that each V_i is either a point or an irreducible plane curves $V(f_i)$, where f_i is an irreducible polynomial and $V(f_i)$ is infinite.

(3) If $V_i = \{(a_i, b_i)\}$ is a point, then define

$$f_i(x, y) = (x - a_i)^2 + (x - b_i)^2.$$

By the property of $\mathbb{R}$, $V_i = V(f_i)$.

(4) Define $f = f_1 \cdots f_m \in \mathbb{R}[x, y]$. Hence,

$$\begin{aligned} V &= V_1 \cup \cdots \cup V_m \\ &= V(f_1) \cup \cdots \cup V(f_m) \\ &= V(f_1 \cdots f_m) \\ &= V(f). \end{aligned}$$

□

Problem 1.31.

(a) *Find the irreducible components of $V(y^2 - xy - x^2y + x^3)$ in $\mathbf{A}^2(\mathbb{R})$, and also in $\mathbf{A}^2(\mathbb{C})$.*

(b) *Do the same for* $V(y^2 - x(x^2 - 1))$*, and for* $V(x^3 + x - x^2y - y)$.

Proof of (a).

(1) Note that

$$\begin{aligned} V(y^2 - xy - x^2y + x^3) &= V((y - x^2)(y - x)) \\ &= V(y - x^2) \cup V(y - x). \end{aligned}$$

(2) Note that $y - x^2$ and $y - x$ are irreducible in $\mathbb{C}[x, y]$ and thus also in $\mathbb{R}[x, y]$ by the similar argument in Problem 1.25(a). Also, $V(y - x^2)$ and $V(y - x)$ are infinite in $\mathbf{A}^2(\mathbb{R})$ and thus also in $\mathbf{A}^2(\mathbb{C})$.

(3) Therefore, $V(y - x^2)$ and $V(y - x)$ are the irreducible components of $V(y^2 - xy - x^2y + x^3)$ in $\mathbf{A}^2(\mathbb{R})$ and also in $\mathbf{A}^2(\mathbb{C})$.

□

Outline of (b).

(1) The elliptic curve $V(y^2 - x(x + 1)(x - 1))$ is irreducible over $\mathbf{A}^2(\mathbb{R})$.

(2) The elliptic curve $V(y^2 - x(x + 1)(x - 1))$ is irreducible over $\mathbf{A}^2(\mathbb{C})$.

(3) The irreducible component of $V(x^3 + x - x^2y - y)$ over $\mathbf{A}^2(\mathbb{R})$ is $V(x - y)$.

(4) The irreducible components of $V(x^3 + x - x^2y - y)$ over $\mathbf{A}^2(\mathbb{C})$ are $V(x + i)$, $V(x - i)$ and $V(x - y)$.

Proof of (b).

(1) Similar to Problem 1.25. To show $y^2 - x(x + 1)(x - 1)$ is irreducible in $\mathbb{C}[x, y]$, we write

$$y^2 - x(x + 1)(x - 1) \in (\mathbb{C}[x])[y].$$

Note that $\mathbb{C}[x]$ is a UFD and $-x(x + 1)(x - 1)$ is the constant term. As $\mathbb{C}[x]/(x) \cong \mathbb{C}$ is a domain, (x) is prime. Clearly, $x \mid x(x+1)(x-1)$ but $x^2 \nmid x(x+1)(x-1)$. By the Eisenstein's criterion, we can say $y^2 - x(x+1)(x-1)$ is irreducible over $(\mathbb{C}[x])[y]$.

(2) Moreover, $V(y^2 - x(x + 1)(x - 1))$ is infinite over $\mathbf{A}^2(\mathbb{R})$ and thus also over $\mathbf{A}^2(\mathbb{C})$. ($y = f(x) = \sqrt{x(x + 1)(x - 1)}$ is continuous and strictly increasing on $[1, \infty)$ in the sense of calculus. As the measure of $[1, \infty)$ is ∞, the set $V(y^2 - x(x + 1)(x - 1))$ is infinite over $\mathbf{A}^2(\mathbb{R})$.)

(3) By Corollary 1 to Proposition 2, $V(y^2 - x(x^2 - 1))$ itself is irreducible over $\mathbf{A}^2(\mathbb{R})$ or $\mathbf{A}^2(\mathbb{C})$.

(4) Consider $V(x^3 + x - x^2y - y) \subseteq \mathbf{A}^2(\mathbb{R})$.

$$\begin{aligned} V(x^3 + x - x^2y - y) &= V((x^2 + 1)(x - y)) \\ &= V(x^2 + 1) \cup V(x - y) \\ &= \varnothing \cup V(x - y) \\ &= V(x - y). \end{aligned}$$

Here we use that fact that $x^2 + 1 = 0$ has no real solution $x \in \mathbb{R}$. Similar to (a), $V(x - y)$ is the only irreducible component of $V(x^3 + x - x^2y - y)$ in $\mathbf{A}^2(\mathbb{R})$.

(5) Consider $V(x^3 + x - x^2y - y) \subseteq \mathbf{A}^2(\mathbb{C})$.

$$\begin{aligned} V(x^3 + x - x^2y - y) &= V((x + i)(x - i)(x - y)) \\ &= V(x + i) \cup V(x - i) \cup V(x - y). \end{aligned}$$

Similar to (a), $V(x \pm i)$ and $V(x - y)$ are the irreducible components of $V(x^3 + x - x^2y - y)$ in $\mathbf{A}^2(\mathbb{C})$.

□

1.7. Hilbert's Nullstellensatz

Problem 1.32.

Show that both theorems and all of the corollaries are false if k is not algebraically closed.

Proof.

(1) Weak Nullstellensatz: $I = (x^2 + 1)$ is a proper ideal in $\mathbb{R}[x]$ but $V(I) = \varnothing$.

(2) Hilbert's Nullstellensatz: Let $I = (y^2 + x^2(x - 1)^2)$ be an ideal in $\mathbb{R}[x, y]$. Hence,

$$\begin{aligned} I(V(I)) &= I(\{(0, 0), (1, 0)\}) && \text{(Problem 1.26.)} \\ &= (x(x - 1), y) \\ &\neq I \\ &= \operatorname{rad}(I). \end{aligned}$$

The last equality holds since f is irreducible in a UFD $\mathbb{R}[x, y]$ and thus I is a prime ideal.

(3) Corollary 1: Same example in the case Hilbert's Nullstellensatz. If $I = (y^2 + x^2(x - 1)^2)$ is a radical ideal in $\mathbb{R}[x, y]$. Then $I(V(I)) \neq I$.

(4) Corollary 2: Same example in the case Hilbert's Nullstellensatz. If $I = (y^2 + x^2(x-1)^2)$ is a prime ideal in $\mathbb{R}[x, y]$, then

$$V(I) = \{(0,0), (1,0)\} = V(x, y) \cup V(x-1, y)$$

is reducible. Next, consider a prime ideal $J = (x^2 + y^2)$ in $\mathbb{R}[x, y]$. (Use the same argument in Problem 1.26 to get the irreducibility of $x^2 + y^2$.) $V(J) = \{(0,0)\}$ is a point but J is not a maximal ideal (since $J \subsetneq (x^2 + y^2, x) \subsetneq (1)$).

(5) Corollary 3: Same example in Corollary 2.

(6) Corollary 4: Let $I = (x^2+y^2)$ be an ideal in $\mathbb{R}[x, y]$. Then $V(I) = \{(0,0)\}$ is a finite set. But $\mathbb{R}[x, y]/(x^2+y^2)$ is an infinite dimensional vector space over $\mathbb{R}$. In fact, the monomials

$$\{\overline{x^m}, \overline{x^m y} : m = 0, 1, 2, \ldots\}$$

is a basis for $\mathbb{R}[x, y]/(x^2 + y^2)$.

□

Problem 1.33.

(a) *Decompose* $V(x^2+y^2-1, x^2-z^2-1) \subseteq \mathbf{A}^3(\mathbb{C})$ *into irreducible components.*

(b) *Let* $V = \{(t, t^2, t^3) \in \mathbf{A}^3(\mathbb{C}) : t \in \mathbb{C}\}$. *Find* $I(V)$, *and show that* V *is irreducible.*

Proof of (a).

(1) Write

$$\begin{aligned} & V(x^2 + y^2 - 1, x^2 - z^2 - 1) \\ = {} & V(x^2 + y^2 - 1, y^2 + z^2) \\ = {} & V(x^2 + y^2 - 1, (y + iz)(y - iz)) \\ = {} & V(x^2 + y^2 - 1, y + iz) \cup V(x^2 + y^2 - 1, y - iz). \end{aligned}$$

By the Hilbert's Nullstellensatz, it suffices to show that $(x^2+y^2-1, y+iz)$ and $(x^2 + y^2 - 1, y - iz)$ are prime.

(2) *Show that* $I = (x^2 + y^2 - 1, y + iz)$ *is prime in* $\mathbb{C}[x, y, z]$. Note that

$$\mathbb{C}[x, y, z]/I \cong \mathbb{C}[x, y]/(x^2 + y^2 - 1)$$

is a ring isomorphism defined by

$$f(x, y, z) + I \mapsto f(x, y, -iy) + (x^2 + y^2 - 1).$$

(Use the similar argument in (b) to prove it is indeed an isomorphism.) So it suffices to show that

$$x^2 + y^2 - 1 \in \mathbb{C}[x, y]$$

is irreducible. (Thus, $\mathbb{C}[x, y]/(x^2 + y^2 - 1) \cong \mathbb{C}[x, y, z]/I$ is a domain, or I is prime.) We can use the similar argument in Problem 1.31 (b) to show $x^2 + y^2 - 1 = y^2 + (x+1)(x-1)$ is irreducible as showing the irreducibility of $y^2 - x(x+1)(x-1)$.

(3) Similarly, $I = (x^2 + y^2 - 1, y - iz)$ is prime. Therefore, the irreducible components of $V(x^2 + y^2 - 1, x^2 - z^2 - 1)$ are $V(x^2 + y^2 - 1, y + iz)$ and $V(x^2 + y^2 - 1, y - iz)$.

□

Proof of (b).

(1) Write

$$V = \{(t, t^2, t^3) \in \mathbf{A}^3(\mathbb{C}) : t \in \mathbb{C}\} = V(x^2 - y, x^3 - z).$$

Let $I = (x^2 - y, x^3 - z)$ in $\mathbb{C}[x, y, z]$. By the Hilbert's Nullstellensatz, $I(V) = \mathrm{rad}(I)$. So it suffices to show that $I = (x^2 - y, x^3 - z)$ is prime (and thus V is irreducible).

(2) *Show that*

$$\mathbb{C}[x, y, z]/I \cong \mathbb{C}[t]$$

is a domain, and thus $I = (x^2 - y, x^3 - z)$ is a prime ideal.

(a) Define a ring homomorphism $\alpha : \mathbb{C}[x, y, z]/I \to \mathbb{C}[t]$ by

$$\alpha : f(x, y, z) + I \mapsto f(t, t^2, t^3).$$

α is well-defined since $\alpha((x^2 - y) + I) = 0$ and $\alpha((x^3 - z) + I) = 0$.

(b) *Show that α is surjective.*

$$\alpha : g(x) + I \in \mathbb{C}[x, y, z]/I \mapsto g(t) \in \mathbb{C}[t]$$

for any $g(t)$.

(c) *Show that α is injective.* Suppose $\alpha(f(x, y, z) + I) = 0$. Write

$$\begin{aligned} f(x, y, z) + I &= \sum_{(i)} \lambda_{(i)} x^{i_1} (y - x^2)^{i_2} (z - x^3)^{i_3} + I \\ &= \sum_i \lambda_i x^i + I. \end{aligned}$$

So

$$0 = \alpha(f(x, y, z) + I) = \alpha\left(\sum_i \lambda_i x^i + I\right) = \sum_i \lambda_i t^i.$$

Hence, $\ker(\alpha) = I$.

□

Problem 1.34.

Let R be a UFD.

(a) *Show that a monic polynomial of degree two or three in $R[x]$ is irreducible if and only if it has no root in R.*

(b) *$x^2 - a \in R[x]$ is irreducible if and only if a is not a square in R.*

Proof of (a).

(1) It is equivalent to show that a monic polynomial of degree two or three in $R[x]$ is reducible if and only if it has one root in R.

(2) Suppose f is reducible of degree 2 or 3. Then there exist nonconstant monic polynomials $g, h \in R[x]$ such that $f = gh$. By

$$\deg(g) + \deg(h) = \deg(f) = 2 \text{ or } 3,$$

we may assume that $\deg(g) = 1$. (Otherwise g or h will be a constant polynomial.) Say $g(x) = x - a$ where $a \in R$. Now

$$f(a) = g(a)h(a) = 0$$

implies that $a \in R$ is a root of f.

(3) Conversely, if $a \in R$ is a root of f, then apply the same argument in Problem 1.7 we can write

$$f = (x - a)g$$

for some $g \in R[x]$. Here $\deg(g) \geq 1$ since $\deg(f) = 1 + \deg(g) \geq 2$. Therefore, f is reducible.

□

Proof of (b). By (a), $x^2 - a \in R[x]$ is reducible $\iff$ $x^2 - a$ has one root $\alpha \in R$ $\iff$ $a = \alpha^2$ is a square in R for some $\alpha \in R$. □

Problem 1.35.

Show that $V(y^2 - x(x-1)(x-\lambda)) \subseteq \mathbf{A}^2(k)$ is an irreducible curve for any algebraically closed field k, and any $\lambda \in k$.

Proof.

(1) By the Hilbert's Nullstellensatz, it suffices to show that

$$I = (y^2 - x(x-1)(x-\lambda))$$

is a prime ideal in $k[x, y]$, or show that

$$y^2 - x(x-1)(x-\lambda)$$

is irreducible (since $k[x, y]$ is a UFD).

(2) By Problem 1.34(b), $y^2 - x(x-1)(x-\lambda) \in (\mathbb{C}[x])[y]$ is irreducible if $x(x-1)(x-\lambda)$ is not a square in $\mathbb{C}[x]$. Note that every square in $\mathbb{C}[x]$ is of even degree. So $x(x-1)(x-\lambda)$ cannot be a square in $\mathbb{C}[x]$ since $\deg(x(x-1)(x-\lambda)) = 3$ is odd.

□

Note. $V(y^2 - x(x-1)(x-\lambda))$ is the elliptic curve as Problem 1.31.

Problem 1.36.

Let $I = (y^2 - x^2, y^2 + x^2) \subseteq \mathbb{C}[x, y]$. *Find* $V(I)$ *and* $\dim_{\mathbb{C}}(\mathbb{C}[x, y]/I)$.

Proof.

(1) Clearly, $V(I) = \{(0, 0)\}$ is a finite set. By Corollary 4 to the Hilbert's Nullstellensatz,

$$\dim_{\mathbb{C}}(\mathbb{C}[x, y]/I) < \infty.$$

In fact, $\dim_{\mathbb{C}}(\mathbb{C}[x, y]/I) = 4$.

(2) Given any $f + I \in \mathbb{C}[x, y]/I$ where $f \in \mathbb{C}[x, y]$. Write

$$f(x, y) = \sum_i f_i(x) y^i$$

where $f_i(x) = \sum_j a_{ij} x^j \in \mathbb{C}[x]$. Note that

$$x^2 = \frac{1}{2}(y^2 + x^2) - \frac{1}{2}(y^2 - x^2) \in I,$$
$$y^2 = \frac{1}{2}(y^2 + x^2) + \frac{1}{2}(y^2 - x^2) \in I.$$

So

$$\begin{aligned} f(x,y)+I &= \sum_i f_i(x)y^i + I \\ &= f_0(x) + f_1(x)y + I \\ &= \sum_j a_{0j}x^j + \left(\sum_j a_{1j}x^j\right) y + I \\ &= a_{00} + a_{01}x + a_{10}y + a_{11}xy + I \end{aligned}$$

is generated by $\mathscr{B} = \{\overline{1}, \overline{x}, \overline{y}, \overline{xy}\}$.

(3) Note that $\mathscr{B}$ is a basis since any linear combination of elements in $\mathscr{B}$ is not in I. Therefore,

$$\dim_{\mathbb{C}}(\mathbb{C}[x,y]/I) = |\mathscr{B}| = 4.$$

□

Problem 1.37.*

Let K be any field, $f \in K[x]$ a polynomial of degree $n > 0$. Show that the residues $\overline{1}, \overline{x}, \ldots, \overline{x}^{n-1}$ form a basis for $K[x]/(f)$ over K.

Proof.

(1) *Show that every element in $K[x]/(f)$ is generated by $\mathscr{B} = \{\overline{1}, \overline{x}, \ldots, \overline{x}^{n-1}\}$.* Given any $\overline{g} \in K[x]/(f)$ with $g \in K[x]$. By the division-with-remainder property of $K[x]$, there are some polynomials $q, r \in K[x]$ such that

$$g = fq + r$$

where $r = 0$ or $\deg(r) < n$ if $r \neq 0$. Therefore,

$$g + (f) = fq + r + (f) = r + (f).$$

Note that $r + (f)$ is generated by $\mathscr{B}$.

(2) *Show that $\mathscr{B}$ is a basis for $K[x]/(f)$ over K.* Suppose

$$a_0 + a_1x + \cdots + a_{n-1}x^{n-1} \in (f)$$

for $a_1, \ldots, a_{n-1} \in K$. We can regard any linear combination of $\{1, x, \ldots, x^{n-1}\}$ as a polynomial $r(x)$ in $K[x]$. $r \in (f)$ implies that there exists a polynomial $g \in K[x]$ such that $r = fg$. If $g \neq 0$, then $\deg(r) = \deg(f) + \deg(g) \geq n$, which is impossible. So $g = 0$ and thus $r = fg = 0 \in K[x]$. Therefore, $a_0 = a_1 = \cdots = a_{n-1} = 0 \in K$ and

$$\dim_K(K[x]/(f)) = \deg(f).$$

□

Problem 1.38.*

Let $R = k[x_1, \ldots, x_n]$, k algebraically closed, $V = V(I)$. Show that there is a natural one-to-one correspondence between algebraic subsets of V and radical ideals in $k[x_1, \ldots, x_n]/I$, and that irreducible algebraic sets (resp. points) correspond to prime ideals (resp. maximal ideals). (See Problem 1.22.)

Proof.

(1) Given any algebraic subset W of V. By the Hilbert's Nullstellensatz,

$$I(W) \supseteq I(V) = \mathrm{rad}(I) \supseteq I.$$

(2) By Corollary 1 to the Hilbert's Nullstellensatz and Problem 1.22(b), we have a one-to-one correspondence such that

$$\begin{aligned} &\{\text{algebraic subsets of } V\} \\ \longleftrightarrow\ &\{\text{radical ideals containing } I\} \\ \longleftrightarrow\ &\{\text{radical ideals of } k[x_1, \ldots, x_n]/I\}. \end{aligned}$$

(3) Again by Corollary 2 to the Hilbert's Nullstellensatz and Problem 1.22(b), we have a one-to-one correspondence such that

$$\begin{aligned} &\{\text{irreducible algebraic subsets (resp. points) of } V\} \\ \longleftrightarrow\ &\{\text{prime (resp. maximal) ideals containing } I\} \\ \longleftrightarrow\ &\{\text{prime (resp. maximal) ideals of } k[x_1, \ldots, x_n]/I\}. \end{aligned}$$

□

Problem 1.39.

(a) *Let R be a UFD, and let $\mathfrak{p} = (t)$ be a principal proper prime ideal. Show that there is no prime ideal $\mathfrak{q}$ such that $0 \subsetneq \mathfrak{q} \subsetneq \mathfrak{p}$.*

(b) *Let $V = V(f)$ be irreducible hypersurface in $\mathbf{A}^n$. Show that there is no irreducible algebraic set W such that $V \subsetneq W \subsetneq \mathbf{A}^n$.*

Proof of (a).

(1) (Reductio ad absurdum) Suppose that $\mathfrak{q}$ were a prime ideal in R such that $0 \subsetneq \mathfrak{q} \subsetneq \mathfrak{p}$.

(2) *Show that there is an irreducible element in* $\mathfrak{q}$. Given any $q \in \mathfrak{q}$. Since $\mathfrak{q}$ is proper, we can write

$$q = q_1 \cdots q_n$$

as a product of irreducible elements in a UFD. Since $\mathfrak{q}$ is prime, there is one irreducible element $q_i \in \mathfrak{q}$.

(3) Now $q_i \in \mathfrak{q} \subseteq \mathfrak{p} = (t)$. So $q_i = ut$ for some $u \in R$. By the irreducibility of q_i, u is a unit or t is a unit. If u is a unit, then

$$(t) = (q_i) \subseteq \mathfrak{q} \subseteq \mathfrak{p} = (t).$$

So $\mathfrak{q} = \mathfrak{p}$, which is absurd. If t is a unit, then $\mathfrak{p} = (1)$, contrary to the primality of $\mathfrak{p}$.

□

Proof of (b).

(1) We might assume that $k = \overline{k}$. By Corollary 3 to the Hilbert's Nullstellensatz and the irreducibility of $V(f)$, there are an irreducible polynomial $g \in k[x_1, \ldots, x_n]$ and an integer $m > 0$ such that

$$f = g^m,$$

and

$$I(V(f)) = (g).$$

(2) (Reductio ad absurdum) Suppose that there were an irreducible algebraic set W such that $V \subsetneq W \subsetneq \mathbf{A}^n$. Then by Corollary 3 to the Hilbert's Nullstellensatz again,

$$(g) = I(V(f)) \supsetneq I(W) \supsetneq (1) \in k[x_1, \ldots, x_n].$$

Here $(g) = I(V(f))$ and $I(W)$ are all prime.

(3) Note that (g) is a principal proper prime ideal in a UFD $k[x_1, \ldots, x_n]$. By (a), such ideal $I(W)$ cannot be prime, which is absurd.

□

Problem 1.40.

Let $I = (x^2 - y^3, y^2 - z^3) \subseteq k[x, y, z]$. *Define* $\alpha : k[x, y, z] \to k[t]$ *by* $\alpha(x) = t^9$, $\alpha(y) = t^6$, $\alpha(z) = t^4$.

(a) *Show that every element of* $k[x, y, z]/I$ *is the residue of an element* $a + xb + yc + xyd$, *for some* $a, b, c, d \in k[z]$.

(b) *If* $f = a + xb + yc + xyd$, $a, b, c, d \in k[z]$ *and* $\alpha(f) = 0$, *compare like powers of* t *to conclude that* $f = 0$.

(c) *Show that* $\ker(\alpha) = I$, *so* I *is prime,* $V(I)$ *is irreducible, and* $I(V(I)) = I$.

Proof of (a).

(1) Take any element $\overline{f} \in k[x, y, z]/I$ where $f \in k[x, y, z]$. Regard $f \in (k[y, z])[x]$, By the division-with-remainder property of $(k[y, z])[x]$,

$$f = (x^2 - y^3)q + r$$

where $q, r \in (k[y, z])[x]$ and $r = 0$ or $\deg_x(r) < 2$. In any case, $r = xr_1 + r_0$ for some $r_1, r_0 \in k[y, z]$.

(2) Apply the same argument to (1), we have

$$r_0 = (y^2 - z^3)q_0 + yc + a$$
$$r_1 = (y^2 - z^3)q_1 + yd + b$$

where $q_0, q_1 \in k[y, z]$ and $a, b, c, d \in k[z]$.

(3) By $\overline{r_0} = \overline{yc} + \overline{a}$ and $\overline{r_1} = \overline{yd} + \overline{b}$,

$$\begin{aligned}\overline{f} &= \overline{r} \\ &= \overline{xr_1} + \overline{r_0} \\ &= \overline{x}(\overline{yd} + \overline{b}) + (\overline{yc} + \overline{a}) \\ &= \overline{a} + \overline{b} \cdot \overline{x} + \overline{c} \cdot \overline{y} + \overline{d} \cdot \overline{xy}.\end{aligned}$$

□

Proof of (b). As $0 = \alpha(f) = a + ct^6 + bt^9 + dt^{15} \in k[t]$, $a = b = c = d = 0 \in k$.
□

Proof of (c).

(1) $I \subseteq \ker(\alpha)$ is trivial.

(2) *Show that* $\ker(\alpha) \subseteq I$. Take any $f \in \ker(\alpha)$, or $\alpha(f) = 0$. By (a), $f = r + f_1$ where $f_1 \in I$ and $r = a + bx + cy + dxy \in k[x, y, z]$ for some $a, b, c, d \in k[z]$. Note that α is a ring homomorphism. Therefore,

$$0 = \alpha(f) = \alpha(r + f_1) = \alpha(r) + \alpha(g) = \alpha(r).$$

By (b), $r = 0 \in k[x, y, z]$ and thus $f = f_1 \in I$.

(3) Therefore,

$$\alpha : k[x, y, z]/(x^2 - y^3, y^2 - z^3) \hookrightarrow k[t]$$

is injective.

□

1.8. Modules; Finiteness Conditions

Problem 1.41.*

If S is module-finite over R, then S is ring-finite over R.

Proof.

(1) Write $S = \sum Rs_i$ for some $s_1, \ldots, s_n \in S$ since S is module-finite over R.

(2) *Show that* $\sum Rs_i = R[s_1, \ldots, s_n]$. $\sum Rs_i \subseteq R[s_1, \ldots, s_n]$ is trivial. Conversely, take any $v \in R[s_1, \ldots, s_n]$. Write

$$v = \sum_{(j)} \overbrace{\underbrace{a_{(j)}}_{\in R} \underbrace{s_1^{j_1} \cdots s_n^{j_n}}_{\in S = \sum Rs_i}}^{\in \sum Rs_i}$$

Here each term $a_{(i)} s_1^{i_1} \cdots s_n^{i_n}$ is in $\sum Rs_i$. As $\sum Rs_i$ is an R-module,

$$v = \sum_{(i)} a_{(i)} s_1^{i_1} \cdots s_n^{i_n} \in \sum Rs_i.$$

□

Note. The converse is not true (by Problem 1.42).

Problem 1.42.

Show that $S = R[x]$ (the ring of polynomials in one variable) is ring-finite over R, but not module-finite.

Proof.

(1) $S = R[x]$ is ring-finite over R by definition (as $x \in S$).

(2) (Reductio ad absurdum) If $S = \sum Rs_i$ for some $s_1, \ldots, s_n \in S$ were module-finite over R. Any element $s \in \sum Rs_i$ is of degree

$$\deg s \leq \max_{1 \leq i \leq n} \deg s_i := m.$$

So that $x^{m+1} \in S = R[x]$ but not in $\sum Rs_i$, which is absurd.

□

Problem 1.43.*

If L is ring-finite over K (K, L fields) then L is a finitely generated field extension of K.

Proof.

(1) $L = K[v_1, \cdots, v_n]$ for some $v_i \in L$ since L is ring-finite over K.

(2) Apply Proposition 4 in §1.10, L is module-finite (and hence algebraic) over K, that is, $L = K[v_1, \cdots, v_n] = K(v_1, \cdots, v_n)$ is a finitely generated field extension of K.

□

Problem 1.44.*

Show that $L = K(x)$ (the field of rational functions in one variable) is a finitely generated field extension of K, but L is not ring-finite over K. (Hint: If L were ring-finite over K, a common denominator of ring generators would be an element $b \in K[x]$ such that for all $z \in L$, $b^n z \in K[x]$ for some n; but let $z = 1/c$, where c doesn't divide b (Problem 1.5).)

Proof.

(1) (Reductio ad absurdum) Suppose that L were ring-finite over K. Write $L = K[v_1, \ldots, v_m]$ where $v_1, \ldots, v_m \in L = K(x)$. Let $b \in K[x]$ be a common denominator of ring generators $v_1, \ldots, v_m$. (So that all $bv_i \in K[x]$.) Therefore, for any $z \in L = K[v_1, \ldots, v_m]$, there is an integer $n > 0$ such that $b^n z \in K[x]$.

(2) Consider $z = 1/c \in K(x)$, where $c \in K[x]$ doesn't divide b. The existence of c is guaranteed by Problem 1.5. Hence, for any integer $n > 0$

$$b^n z = b^n / c$$

is never in $K[x]$ by the construction of c, which is absurd.

□

Problem 1.45.*

Let R be a subring of S, S a subring of T.

(a) *If $S = \sum Rv_i$, $T = \sum Sw_j$, show that $T = \sum Rv_iw_j$.*

(b) *If $S = R[v_1, \ldots, v_n]$, $T = S[w_1, \ldots, w_m]$, show that $T = R[v_1, \ldots, v_n, w_1, \ldots, w_m]$.*

(c) *If R, S, T are fields, and $S = R(v_1, \ldots, v_n)$, $T = S(w_1, \ldots, w_m)$, show that $T = R(v_1, \ldots, v_n, w_1, \ldots, w_m)$.*

So each of the three finiteness conditions is a transitive relation.

Proof of (a).

(1) *Show that $T \subseteq \sum Rv_iw_j$.* Given any $t \in T = \sum Sw_j$. There are some $s_j \in S$ such that $t = \sum_j s_jw_j$. As $s_j \in S = \sum Rv_i$, there are some $r_{ij} \in R$ such that $s_j = \sum_i r_{ij}v_i$. Hence,

$$t = \sum_j s_jw_j = \sum_j \left(\sum_i r_{ij}v_i \right) w_j = \sum_{i,j} r_{ij}v_iw_j \in \sum Rv_iw_j.$$

(2) *Show that $T \supseteq \sum Rv_iw_j$.* Take any $\sum r_{ij}v_iw_j \in \sum Rv_iw_j$.

$$\sum r_{ij}v_iw_j = \sum_j \left(\sum_i r_{ij}v_i \right) w_j \in \sum_j Sw_j = T.$$

□

Proof of (b).

(1) Note that $R[x_1, \cdots, x_m]$ is canonically isomorphic to $R[x_1, \cdots, x_{m-1}][x_m]$. Hence $R[x_1, \cdots, x_m]$ is isomorphic to $R[x_1][x_2] \cdots [x_m]$.

(2) Hence,

$$\begin{aligned} T &= S[w_1, \ldots, w_m] \\ &= R[v_1, \ldots, v_n][w_1, \ldots, w_m] \\ &= R[v_1, \ldots, v_n][w_1] \cdots [w_m] \\ &= R[v_1] \cdots [v_n][w_1] \cdots [w_m] \\ &= R[v_1, \ldots, v_n, w_1, \ldots, w_m]. \end{aligned}$$

□

Proof of (c).

(1) By (b), $R(v_1, \ldots, v_n)$ is canonically isomorphic to $R(v_1, \ldots, v_{n-1})(v_n)$. Hence $R(v_1, \ldots, v_n)$ is isomorphic to $R(v_1) \cdots (v_n)$. To see this, note that $R[x_1, \cdots, x_m] \cong R[x_1, \cdots, x_{m-1}][x_m]$ implies that

$$R(x_1, \cdots, x_m) \cong R[x_1, \cdots, x_{m-1}](x_m) \hookrightarrow R(x_1, \cdots, x_{m-1})(x_m).$$

Conversely, for any $a/b \in R(x_1, \cdots, x_{m-1})(x_m)$ where

$$a = \sum_i a_i x_m^i \in R(x_1, \cdots, x_{m-1})[x_m],$$
$$b = \sum_j b_j x_m^j \in R(x_1, \cdots, x_{m-1})[x_m]$$

and $b \neq 0$, there is a nonzero polynomial $c \in R[x_1, \cdots, x_{m-1}]$ such that all ca_i and cb_j are in $R[x_1, \cdots, x_{m-1}]$. Hence,

$$\begin{aligned} \frac{a}{b} &= \frac{\sum_i a_i x_m^i}{\sum_j b_j x_m^j} \\ &= \frac{c\sum_i a_i x_m^i}{c\sum_j b_j x_m^j} \\ &= \frac{\sum_i ca_i x_m^i}{\sum_j cb_j x_m^j} \\ &\in R[x_1, \cdots, x_{m-1}](x_m). \end{aligned}$$

(2) Hence,

$$\begin{aligned} T &= S(w_1, \ldots, w_m) \\ &= R(v_1, \ldots, v_n)(w_1, \ldots, w_m) \\ &= R(v_1, \ldots, v_n)(w_1) \cdots (w_m) \\ &= R(v_1) \cdots (v_n)(w_1) \cdots (w_m) \\ &= R(v_1, \ldots, v_n, w_1, \ldots, w_m). \end{aligned}$$

□

1.9. Integral Elements

Problem 1.46.* (Transitivity of integral extensions)

Let R be a subring of S, S a subring of (a domain) T. If S is integral over R, and T is integral over S, show that T is integral over R. (Hint: Let $z \in T$, so we have $z^n + a_1 z^{n-1} + \cdots + a_n = 0$, $a_i \in S$. Then $R[a_1, \ldots, a_n, z]$ is module-finite

over R.)

Proof (Hint).

(1) Let $z \in T$, so we have $z^n + a_1 z^{n-1} + \cdots + a_n = 0$, $a_i \in S$. Therefore, z is integral over $R[a_1, \ldots, a_n]$, or $R[a_1, \ldots, a_n, z]$ is module-finite over $R[a_1, \ldots, a_n]$.

(2) *Show that $R[a_1, \ldots, a_n]$ is module-finite over R if all $a_i \in S$.* Note that

$$\begin{aligned} &a_1 \text{ is integral over } R, \\ &a_2 \text{ is integral over } R[a_1] \supseteq R, \\ &\cdots \\ &a_n \text{ is integral over } R[a_1, \ldots, a_{n-1}]. \end{aligned}$$

By Proposition 3,

$$\begin{aligned} &R[a_1] \text{ is module-finite over } R, \\ &R[a_1][a_2] \text{ is module-finite over } R[a_1], \\ &\cdots \\ &R[a_1, \ldots, a_{n-1}][a_n] \text{ is module-finite over } R[a_1, \ldots, a_{n-1}]. \end{aligned}$$

Also note that $R[a_1, \ldots, a_i] = R[a_1, \ldots, a_{i-1}][a_i]$ if $i > 1$. By the transitive relation of the module-finiteness (Problem 1.45), $R[a_1, \ldots, a_n]$ is module-finite over R.

(3) Again by the transitive relation of the module-finiteness (Problem 1.45), $R[a_1, \ldots, a_n, z]$ is module-finite over R. Hence, $R[a_1, \ldots, a_n, z]$ is a subring of T containing $R[z]$ which is module-finite over R. By Proposition 3, z is integral over R.

□

Problem 1.47.*

Suppose (a domain) S is ring-finite over R. Show that S is module-finite over R if and only if S is integral over R.

Proof.

(1) Write $S = R[v_1, \ldots, v_m]$ for some $v_i \in S$.

(2) Suppose that S is integral over R. Then all v_i are integral over R. Use the same argument in Problem 1.46, we have

$$S = R[v_1, \ldots, v_n]$$

is module-finite over R.

(3) Conversely, suppose that S is module-finite over R. Take any $v \in S$. Write $v = \sum_i r_i v_i \in S$ since S is module-finite over R. Note that $S = R[v_1, \ldots, v_m]$ is a subring of S itself containing $R[v]$ which is module-finite over R. By Proposition 3, v is integral over R.

□

Problem 1.48.*

Let L be a field, k an algebraically closed subfield of L.

(a) *Show that any element of L that is algebraic over k is already in k.*

(b) *An algebraically closed field has no module-finite field extensions except itself.*

Proof of (a).

(1) Let $\alpha \in L$ be algebraic over k. Then there is a nonzero polynomial $f(x) \in k[x]$ with $f(\alpha) = 0$. Note that $\deg f \geq 1$.

(2) Since k is algebraically closed, every polynomial is a product of first degree polynomials, say

$$f(x) = c(x - \alpha_1) \cdots (x - \alpha_m)$$

where $c \in k - \{0\}$ and $\alpha_1, \ldots, \alpha_m \in k$. As $f(\alpha) = 0$, $\alpha = \alpha_i \in k$ for some $1 \leq i \leq m$. Hence, $\alpha \in L$ is algebraic over k implies that $\alpha \in k$.

□

Proof of (b).

(1) Suppose that L is module-finite field extensions of an algebraically closed field k.

(2) By Problem 1.41, L is ring-finite over k. By Problem 1.47, L is integral or algebraic over k (since k is a field). By (a), $L = k$.

□

Problem 1.49.*

Let K be a field, $L = K(x)$ the field of rational functions in one variable over K.

(a) *Show that any element of L that is integral over $K[x]$ is already in $K[x]$. (Hint: If $z^n + a_1 z^{n-1} + \cdots + a_n = 0$, write $z = f/g$, f, g relatively prime. Then $f^n + a_1 f^{n-1} g + \cdots + a_n g^n = 0$, So g divides f.)*

(b) *Show that there is no nonzero element $f \in K[x]$ such that for every $z \in L$, $f^n z$ is integral over $K[x]$ for some $n > 0$. (Hint: See Problem 1.44.)*

Proof of (a).

(1) Note that 0 is integral over $K[x]$ and $0 \in K[x]$ trivially.

(2) Now we take any nonzero element $z \in L = K(x)$ which is integral over $K[x]$. So $z^n + a_1 z^{n-1} + \cdots + a_n = 0$ for some $a_1, \ldots, a_n \in K[x]$ and $a_n \neq 0$ (since $z \neq 0$).

(3) Write $z = f/g$, f, g relatively prime in $K[x]$. Then

$$f^n + a_1 f^{n-1} g + \cdots + a_n g^n = 0 \in K[x].$$

Since $a_n \neq 0$, $g \mid f^n$ or $g \mid f$ or $g = 1 \in K$. Therefore, $z = f \in K[x]$.

□

Proof of (b).

(1) (Reductio ad absurdum) Suppose there were a nonzero element $f \in K[x]$ such that for every $z \in L$, $f^n z$ is integral over $K[x]$ for some $n > 0$.

(2) Let $z = 1/g \in K(x)$, where g is an irreducible polynomial not dividing f. The existence of g is guaranteed by Problem 1.5.

(3) By the hypothesis in (1), there is an integer $n > 0$ such that $f^n z$ is integral over $K[x]$. By (a), $f^n z = f^n/g$ is also in $K[x]$. So $g \mid f^n$ or $g \mid f$, which is absurd.

□

Problem 1.50.*

Let K be a subfield of a field L.

(a) *Show that the set of elements of L that are algebraic over K is a subfield of L containing K. (Hint: If $v^n + a_1 v^{n-1} + \cdots + a_n = 0$, and $a_n \neq 0$, then $v(v^{n-1} + \cdots + a_{n-1}) = -a_n$.)*

(b) *Suppose L is module-finite over K, and $K \subseteq R \subseteq L$, R a subring of L. Show that R is a field.*

Proof of (a).

(1) Let R be the set of elements of L that are algebraic over K. By Corollary to Proposition 3, R is a subring of L containing K. (Note that K is a field.) So it suffices to show that $v^{-1} \in R$ if $v \in R - \{0\}$.

(2) Since v is algebraic over K, we can write

$$v^n + a_1 v^{n-1} + \cdots + a_n = 0$$

for some $a_1, \ldots, a_n \in K$ and $a_n \neq 0$. So

$$\left(v^{-1}\right)^n + \underbrace{\frac{a_{n-1}}{a_n}}_{\in K} \left(v^{-1}\right)^{n-1} + \cdots + \underbrace{\frac{a_1}{a_n}}_{\in K} \left(v^{-1}\right) + \underbrace{\frac{1}{a_n}}_{\in K} = 0,$$

or v^{-1} is integral over K. Hence, $v^{-1} \in R$.

□

Proof of (b).

(1) By Problem 1.47, L is algebraic over K. Hence, R is algebraic over K.

(2) To show that R is a field, it suffices to show that $v^{-1} \in R$ if $v \in R - \{0\}$. Since v is algebraic over K, we can write

$$v^n + a_1 v^{n-1} + \cdots + a_n = 0$$

for some $a_1, \ldots, a_n \in K$ and $a_n \neq 0$. So

$$v \left(- \underbrace{\frac{1}{a_n}}_{\in K \subseteq R} \underbrace{v^{n-1}}_{\in R} - \cdots - \underbrace{\frac{a_{n-1}}{a_n}}_{\in K \subseteq R} \right) = 1.$$

Here $v^{-1} = \left(-\frac{1}{a_n} v^{n-1} - \cdots - \frac{a_{n-1}}{a_n} \right)$ is the inverse of v in R (since R is a ring containing K).

□

1.10. Field Extensions

Problem 1.51.*

Let K be a field, $f \in K[x]$ an irreducible monic polynomial of degree $n > 0$.

(a) *Show that $L = K[x]/(f)$ is a field, and if $\overline{x}$ is the residue of x in L, then $f(\overline{x}) = 0$.*

(b) *Suppose L' is a field extension of K, $y \in L'$ such that $f(y) = 0$. Show that the homomorphism from $K[x]$ to L' that takes x to y induces an isomorphism of L with $K(y)$.*

(c) *With L', y as in (b), suppose $g \in K[x]$ and $g(y) = 0$. Show that f divides g.*

(d) *Show that $f = (x - \overline{x})f_1$, $f_1 \in L[x]$.*

Proof of (a).

(1) (f) is a prime ideal in a UFD $K[x]$ since f is irreducible. Note that $K[x]$ is also a PID, (f) is maximal (Problem 1.3). Hence $L = K[x]/(f)$ is a field.

(2) $f(\overline{x}) = f(x) + (f(x)) = (f(x)) = \overline{0}$.

□

Proof of (b).

(1) Let $\alpha : K[x] \to L'$ be a homomorphism defined by

$$\alpha\left(\sum a_i x^i\right) = \sum a_i y^i$$

where $a_i \in K$. $\mathrm{im}(\alpha) = K(y)$ clearly.

(2) Note that $\ker(\alpha)$ is an ideal containing (f) since $\alpha(f) = 0$. $\ker(\alpha)$ is proper since $\alpha(1) = 1 \neq 0$. By the maximality of (f), $\ker(\alpha) = (f)$.

(3) Hence, α induces an isomorphism of L with $K(y)$:

$$L = K[x]/(f) \cong K(y) \hookrightarrow L'.$$

□

Proof of (c). By (b), $g \in \ker(\alpha) = (f)$. So $f \mid g$. □

Proof of (d).

(1) By (a), $\overline{x} \in L$ is a root of $f \in L[x]$ (by embedding $K[x]$ in $L[x]$).

(2) Since L is a field, by Problem 1.7(b) we have

$$f = (x - \overline{x})f_1$$

for some $f_1 \in L[x]$.

□

Problem 1.52.* (Splitting fields)

Let K be a field, $f \in K[x]$. Show that there is a field L containing K such that $f = \prod_{i=1}^{n}(x - x_i) \in L[x]$. (Hint: Use Problem 1.51(d) and induction on the degree.) L is called a ***splitting field*** *of F.*

Proof.

(1) Let $p(x) \in K[x]$ be an irreducible factor of $f(x) \in K[x]$, and let L' be the field $K[x]/(p(x))$ (by Problem 1.51(a)).

(2) Then we might regard K as a subfield of L' by sending $a \in K$ to $\overline{a} = a + (p(x)) \in L'$.

(3) By Problem 1.51(a), $\overline{x}$ is a root of $p \in L'$; therefore is a root of f.

(4) Induction on n. By (1)(2)(3), there is a field $L' \supseteq K$ such that L' contains a root $\overline{x}$ of $f(x)$, say $f(x) = (x - \overline{x})f_1(x)$ over $L'[x]$ (by Problem 1.51(d)). By induction, there is a field $L \supseteq L'$ such that f_1 splits over L. Hence, f splits over L.

□

Problem 1.53.*

Suppose K is a field of characteristic zero, f an irreducible monic polynomial in $K[x]$ of degree $n > 0$. Let L be a splitting field of f, so $f = \prod_{i=1}^{n}(x - x_i)$, $x_i \in L$. Show that the x_i are distinct. (Hint: Apply Problem 1.51(c) to $g = f_x$; if $(x - \overline{x})^2$ divides f, then $g(\overline{x}) = 0$.)

Proof.

(1) Since $f \in K[x]$ is irreducible over K, $\gcd(f, f_x)$ is 1 or f. As $\mathrm{char}(K) = 0$, $\deg(f_x) = \deg(f) - 1$. So f does not divide f_x or $\gcd(f, f_x) = 1$. Hence, there are polynomials $g, h \in K[x]$ such that

$$1 = fg + f_x h.$$

This equation is also true in $L[x]$.

(2) Note that

$$f = \prod_{i=1}^{n}(x - x_i) \in L[x],$$
$$f_x = \sum_{i=1}^{n}(x - x_1) \cdots \widehat{(x - x_i)} \cdots (x - x_n) \in L[x].$$

If $\overline{x}$ were a multiple root of f, then $f(\overline{x}) = f_x(\overline{x}) = 0$. By (1),

$$1 = f(\overline{x})g(\overline{x}) + f_x(\overline{x})h(\overline{x}) = 0,$$

which is absurd.

□

Problem 1.54.*

Let R be a domain with quotient field K, and let L be a finite algebraic extension of K.

(a) *For any $v \in L$, show that there is a nonzero $a \in R$ such that av is integral over R.*

(b) *Show that there is a basis $v_1, \ldots, v_n$ for L over K (as a vector space) such that each v_i is integral over R.*

Proof of (a).

(1) Take any $v \in L$, which is algebraic over K. Write

$$v^n + a_1 v^{n-1} + \cdots + a_n = 0$$

for some $a_1, \ldots, a_n \in K$ and $a_n \neq 0$. Since K is the quotient field of R, there is a common denominator $a \in R$ of $a_1, \ldots, a_n$. Here $a \neq 0$ and $aa_i \in R$ for all $1 \leq i \leq n$.

(2) Hence,

$$\begin{aligned} & a^n v^n + a^n a_1 v^{n-1} + \cdots + a^n a_n = 0 \\ \iff & (av)^n + \underbrace{(aa_1)}_{\in R}(av)^{n-1} + \underbrace{a(aa_2)}_{\in R}(av)^{n-2} + \cdots + \underbrace{a^{n-1}(aa_n)}_{\in R} = 0. \end{aligned}$$

av is integral over R.

□

Proof of (b).

(1) Since L be a finite algebraic extension of K, there exists a basis

$$\{w_1, \ldots, w_n\}$$

for L over K (as a vector space).

(2) For each $w_i \in L$, there is a nonzero $a_i \in R$ such that $a_i w_i$ is integral over R (by (a)). So it suffices to show that

$$\{a_1 w_1, \ldots, a_n w_n\}$$

is also a basis for L over K.

(3) Suppose

$$0 = \sum_i \alpha_i (a_i w_i) = \sum_i (\alpha_i a_i) w_i$$

for some $\alpha_1, \ldots, \alpha_n \in K$. Since $\{w_1, \ldots, w_n\}$ is a basis, $\alpha_i a_i = 0$ for all i, or $\alpha_i = 0$ for all i (since all $a_i \neq 0$). Hence $\{a_1 w_1, \ldots, a_n w_n\}$ is linearly independent.

(4) Also, for any $w \in L$, we can write

$$\begin{aligned} w &= \underbrace{\beta_1}_{\in K} w_1 + \cdots + \underbrace{\beta_n}_{\in K} w_n \\ &= \underbrace{\frac{\beta_1}{a_1}}_{\in K} (a_1 w_1) + \cdots + \underbrace{\frac{\beta_n}{a_n}}_{\in K} (a_n w_n) \end{aligned}$$

as a linear combination of $\{a_1 w_1, \ldots, a_n w_n\}$ over K.

□

Chapter 2: Affine Varieties

2.1. Coordinate Rings

Problem 2.1.*

Show that the map which associates to each $f \in k[x_1, \ldots, x_n]$ a polynomial function in $\mathscr{F}(V, k)$ is a ring homomorphism whose kernel is $I(V)$.

Proof.

(1) Define a map $\alpha : k[x_1, \ldots, x_n] \to \mathscr{F}(V, k)$. Every polynomial $f \in k[x_1, \ldots, x_n]$ defines a function from V to k by

$$\alpha(f)(a_1, \ldots, a_n) = f(a_1, \ldots, a_n)$$

for all $(a_1, \ldots, a_n) \in V$.

(2) α is a ring homomorphism by construction in (1).

(3) *Show that* $\ker(\alpha) = I(V)$. In fact, given any $f \in k[x_1, \ldots, x_n]$, we have $\alpha(f) = 0$ (sending all $a \in V$ to $0 \in k$) if and only if $f(a) = 0$ for all $a \in V$ if and only if $f \in I(V)$.

(4) Hence,

$$k[x_1, \ldots, x_n]/I(V) = \Gamma(V) \cong \{\text{polynomial functions in } \mathscr{F}(V, k)\}$$

as a ring isomorphism.

□

Problem 2.2.*

*Let $V \subseteq \mathbf{A}^n$ be a variety. A **subvariety** of V is a variety $W \subseteq \mathbf{A}^n$ that is contained in V. Show that there is a natural one-to-one correspondence between algebraic subsets (resp. subvarieties, resp. points) of V and radical ideals (resp. prime ideals, resp. maximal ideals) of $\Gamma(V)$. (See Problems 1.22, 1.38.)*

Proof. Repeat Problem 1.38 by replacing $k[x_1, \ldots, x_n]/I$ by $\Gamma(V)$. □

Problem 2.3.*

Let W be a subvariety of a variety V, and let $I_V(W)$ be the ideal of $\Gamma(V)$ corresponding to W.

(a) *Show that every polynomial function on V restricts to a polynomial function on W.*

(b) *Show that the map from $\Gamma(V)$ to $\Gamma(W)$ defined in part (a) is a surjective homomorphism with kernel $I_V(W)$, so that $\Gamma(W)$ is isomorphic to $\Gamma(V)/I_V(W)$.*

Proof of (a).

(1) Given any polynomial function $f \in \mathscr{F}(V,k)$ on V. There is a polynomial $g \in k[x_1,\ldots,x_n]$ such that $f(P) = g(P)$ for all $P \in V \supseteq W$; thus $f(P) = g(P)$ for all $P \in W$, or $f|_W$ is a polynomial function on W.

(2) The map α : {polynomial functions in $\mathscr{F}(V,k)$} $\to$ {polynomial functions in $\mathscr{F}(W,k)$} in (1) is defined by
$$\alpha(f) = f|_W.$$
It is a ring homomorphism.

□

Proof of (b).

(1) Identify $\Gamma(V)$ (resp. $\Gamma(W)$) with the set of all polynomial functions in $\mathscr{F}(V,k)$ (resp. in $\mathscr{F}(W,k)$) by Problem 2.1. The map
$$\alpha : \Gamma(V) \to \Gamma(W)$$
is defined by
$$\alpha(f + I(V)) = f + I(W).$$
It is well-defined by (a).

(2) *Show that α is surjective.* For any $f+I(W) \in \Gamma(W)$, take $f+I(V) \in \Gamma(V)$ and then $\alpha(f + I(V)) = f + I(W)$. (The choice of $f + I(V)$ depends on the representation of $f + I(W)$ and thus might not be unique.)

(3) *Show that* $\ker(\alpha) = I_V(W)$, *and thus* $\Gamma(W) \cong \Gamma(V)/I_V(W)$. Since α is a surjective homomorphism,
$$\begin{aligned}\ker(\alpha) &= \Gamma(V)/\Gamma(W)\\ &= (k[x_1,\ldots,x_n]/I(V))/(k[x_1,\ldots,x_n]/I(W))\\ &= I(W)/I(V)\\ &= I_V(W).\end{aligned}$$

□

Problem 2.4.*

Let $V \subseteq \mathbf{A}^n$ be a nonempty variety. Show that the following are equivalent:

(i) *V is a point.*

(ii) $\Gamma(V) = k$.

(iii) $\dim_k \Gamma(V) < \infty$.

Proof.

(1) (i) $\Longrightarrow$ (ii). By Corollary 2 to the Hilbert's Nullstellensatz in §1.7, $V = \{(a_1, \ldots, a_n)\}$ corresponds to the maximal ideal

$$I(V) = (x_1 - a_1, \ldots, x_n - a_n)$$

in $k[x_1, \ldots, x_n]$. Hence,

$$\Gamma(V) = k[x_1, \ldots, x_n]/(x_1 - a_1, \ldots, x_n - a_n) \cong k$$

(by Problem 1.24).

(2) (ii) $\Longrightarrow$ (iii). $\dim_k(\Gamma(V)) = \dim_k(k) = 1 < \infty$.

(3) (iii) $\Longrightarrow$ (i). By Corollary 4 to the Hilbert's Nullstellensatz in §1.7, V is a finite set of points in $\mathbf{A}^n$. Since V is a nonempty variety, V is exactly a point.

□

Problem 2.5.

Let f be an irreducible polynomial in $k[x, y]$, and suppose f is monic in y: $f = y^n + a_1(x)y^{n-1} + \cdots + a_n(x)$, with $n > 0$. Let $V = V(f) \subseteq \mathbf{A}^2$. Show that the natural homomorphism from $k[x]$ to $\Gamma(V) = k[x, y]/(f)$ is one-to-one, so that $k[x]$ may be regarded as a subring of $\Gamma(V)$; show that the residues $\overline{1}, \overline{y}, \ldots, \overline{y}^{n-1}$ generate $\Gamma(V)$ over $k[x]$ as a module.

Proof.

(1) $\Gamma(V) = k[x, y]/(f)$ is well-defined since f is irreducible. Define a ring homomorphism $\alpha : k[x] \to \Gamma(V) = k[x, y]/(f)$ by

$$\alpha : g(x) \mapsto g(x) + (f(x, y)).$$

(2) *Show that α is one-to-one.* If there were a nonzero polynomial $g \in k[x]$ such that $\alpha(g) = 0$, then $g = fh$ for some nonzero polynomial $h \in k[x, y]$. Hence

$$0 = \deg_y(g) = \deg_y(f) + \deg_y(h) \geq n > 0,$$

which is absurd. Therefore, α is one-to-one. Hence $k[x]$ may be regarded as a subring of $\Gamma(V)$, and thus the multiplication in $\Gamma(V)$ makes $\Gamma(V)$ a $k[x]$-module.

(3) Given any $g(x, y) + (f(x, y)) \in k[x, y]/(f)$ where $g \in k[x, y] = (k[x])[y]$. By the division-with-remainder property of $(k[x])[y]$,

$$g = fq + r$$

for some $q, r \in (k[x])[y]$ and

$$r = r_1(x)y^{n-1} + \cdots + r_n(x)$$

where $r_1, \ldots, r_n \in k[x]$. Hence

$$\begin{aligned} g + (f) &= fq + r + (f) \\ &= r + (f) \\ &= r_1(x)y^{n-1} + \cdots + r_n(x) + (f) \\ &= \underbrace{r_1(x)}_{\in k[x]}\overline{y}^{n-1} + \cdots + \underbrace{r_n(x)}_{\in k[x]}\overline{1}, \end{aligned}$$

which means that the residues $\overline{1}, \overline{y}, \ldots, \overline{y}^{n-1}$ generate $\Gamma(V)$ over $k[x]$ as a module.

□

2.2. Polynomial Maps

Problem 2.6.*

Let $\varphi : V \to W$, $\psi : W \to Z$. Show that $\widetilde{\psi \circ \varphi} = \widetilde{\varphi} \circ \widetilde{\psi}$. Show that the composition of polynomial maps is a polynomial map.

Proof.

(1) *Show that $\widetilde{\psi \circ \varphi} = \widetilde{\varphi} \circ \widetilde{\psi}$.* It is equivalent to show that

$$(\widetilde{\psi \circ \varphi})(f) = (\widetilde{\varphi} \circ \widetilde{\psi})(f)$$

for all $f \in \mathscr{F}(Z, k)$. In fact,

$$\begin{aligned} &(\widetilde{\psi \circ \varphi})(f) = f \circ \psi \circ \varphi, \\ &(\widetilde{\varphi} \circ \widetilde{\psi})(f) = \widetilde{\varphi}(\widetilde{\psi}(f)) = \widetilde{\varphi}(f \circ \psi) = f \circ \psi \circ \varphi. \end{aligned}$$

(2) *Show that the composition of polynomial maps is a polynomial map.* Say $V \subseteq \mathbf{A}^n, W \subseteq \mathbf{A}^m, Z \subseteq \mathbf{A}^r$. Since φ (resp. ψ) is a polynomial map, there are polynomials $t_1, \ldots, t_m \in k[x_1, \ldots, x_n]$ (resp. $s_1, \ldots, s_r \in k[x_1, \ldots, x_m]$) such that

$$\begin{aligned}\varphi(P) &= (t_1(P), \ldots, t_m(P)) \\ \psi(Q) &= (s_1(Q), \ldots, s_r(Q))\end{aligned}$$

for all $P \in V$ (resp. $Q \in W$). Hence the composition $\psi \circ \varphi$ is

$$\begin{aligned}(\psi \circ \varphi)(P) &= \psi(\varphi(P)) \\ &= \psi(t_1(P), \ldots, t_m(P)) \\ &= (s_1(t_1(P), \ldots, t_m(P)), \ldots, s_r(t_1(P), \ldots, t_m(P))).\end{aligned}$$

So there are polynomials $y_1, \ldots, y_r \in k[x_1, \ldots, x_n]$ defined by

$$y_i(P) = s_i(t_1(P), \ldots, t_m(P))$$

for all $(a_1, \ldots, a_n) \in \mathbf{A}^n$ such that

$$(\psi \circ \varphi)(P) = (y_1(P), \ldots, y_r(P)).$$

(Note that the composition of polynomials is a polynomials.) Hence $\psi \circ \varphi$ is a polynomial map.

□

Problem 2.7.*

If $\varphi : V \to W$ is a polynomial map, and X is an algebraic subset of W, show that $\varphi^{-1}(X)$ is an algebraic subset of V. If $\varphi^{-1}(X)$ is irreducible, and X is contained in the image of φ, show that X is irreducible. This gives a useful test for irreducibility.

Proof.

(1) *Show that $\varphi^{-1}(X) = V(\widetilde{\varphi}(I(X)))$ is algebraic.*

$$\begin{aligned}P \in \varphi^{-1}(X) &\iff \varphi(P) \in X \\ &\iff f(\varphi(P)) = 0 \, \forall f \in I(X) \\ &\iff \widetilde{\varphi}(f)(P) = 0 \, \forall f \in I(X) \\ &\iff g(P) = 0 \, \forall g \in \widetilde{\varphi}(I(X)) \\ &\iff P \in V(\widetilde{\varphi}(I(X))).\end{aligned}$$

Also note that $\widetilde{\varphi}(I(X))$ is an ideal in $k[x_1, \ldots, x_n]$ since φ is a polynomial map.

(2) *If $\varphi^{-1}(X)$ is irreducible, and X is contained in the image of φ, show that X is irreducible.* (Reductio ad absurdum) Suppose that X were reducible or $I(X)$ were not prime. So that there exist two polynomials $f_1, f_2 \notin I(X)$ but $f_1 f_2 \in I(X)$. By definition of $I(X)$, there exist two points $P_1, P_2 \in X$ such that $f_i(P_i) \neq 0$ for $i = 1, 2$.

(3) Since X is contained in the image of φ, there are two corresponding points $Q_1, Q_2 \in \varphi^{-1}(X)$ such that $\varphi(Q_i) = P_i$. So $\widetilde{\varphi}(f_i)(Q_i) = f_i(P_i) \neq 0$, or $\widetilde{\varphi}(f_i) \notin I(\varphi^{-1}(X))$. However

$$\widetilde{\varphi}(f_1)\widetilde{\varphi}(f_2) = \widetilde{\varphi}(f_1 f_2) \in I(\varphi^{-1}(X))$$

since $f_1 f_2 \in I(X)$, contrary to the primality of $I(\varphi^{-1}(X))$.

□

Problem 2.8.

(a) *Show that $\{(t, t^2, t^3) \in \mathbf{A}^3(k) : t \in k\}$ is an affine variety.*

(b) *Show that $V(xz - y^2, yz - x^3, z^2 - x^2 y) \subseteq \mathbf{A}^3(\mathbb{C})$ is a variety. (Hint: $y^3 - x^4$, $z^3 - x^5$, $z^4 - y^5 \in I(V)$. Find a polynomial map from $\mathbf{A}^1(\mathbb{C})$ onto V.)*

Proof of (a).

(1) Let $Y := \{(t, t^2, t^3) \in \mathbf{A}^3(k) : t \in k\}$ be the twisted cubic curve. By Problem 2.7, it suffices to show that there is a polynomial map from $\mathbf{A}^1(k)$ onto Y. Here we use the fact that $\mathbf{A}^1(k)$ is irreducible as $k = \overline{k}$ is infinite (by Problem 1.29).

(2) Define a mapping φ from $\mathbf{A}^1(k)$ to Y by $\varphi(t) = (t, t^2, t^3) \in Y$. φ is a polynomial map. Also, φ is surjective.

□

Note. Also see Problems 1.11 and 1.33 (for the case $k = \mathbb{C}$).

Proof of (b).

(1) We prove for any algebraically closed field k.

(2) Write

$$V = V(xz - y^2, yz - x^3, z^2 - x^2 y),$$
$$Y = \{(t^3, t^4, t^5) \in \mathbf{A}^3(k) : t \in k\}.$$

We want to show that $Y = V$. $Y \subseteq V$ is trivial. Now given any $(x, y, z) \in V$. If $x = 0$, then $y = z = 0$. So $(x, y, z) = (0, 0, 0) \in Y$. If $x \neq 0$, define

$$t = \frac{y}{x} \in k.$$

Hence,

$$\begin{aligned} t^3 &= \frac{y^3}{x^3} = \frac{y(xz)}{x^3} = \frac{yz}{x^2} = \frac{x^3}{x^2} = x, \\ t^4 &= tx = y, \\ t^5 &= ty = \frac{y^2}{x} = \frac{xz}{x} = z. \end{aligned}$$

(3) Same as (a). Define a mapping φ from $\mathbf{A}^1(k)$ to $Y = V$ by $\varphi(t) = (t^3, t^4, t^5) \in Y = V$.

□

Note.

(1) We don't use the hint.

(2) In fact, it is easy to show that

$$Y = V(y^3 - x^4, z^3 - x^5, z^4 - y^5).$$

(3) $I(V)$ is a prime ideal of height 2 in $k[x, y, z]$ which cannot be generated by 2 elements. We say V is **not a local complete intersection**.

Problem 2.9.*

Let $\varphi : V \to W$ be a polynomial map of affine varieties, $V' \subseteq V$, $W' \subseteq W$ subvarieties. Suppose $\varphi(V') \subseteq W'$.

(a) *Show that $\widetilde{\varphi}(I_W(W')) \subseteq I_V(V')$ (see Problems 2.3).*

(b) *Show that the restriction of φ gives a polynomial map from V' to W'.*

Proof of (a).

(1) It suffices to show that $f \in I_V(V')$ for any $f = \widetilde{\varphi}(g) \in \widetilde{\varphi}(I_W(W'))$ for some $g \in I_W(W')$.

(2) To show $f \in I_V(V')$, it suffices to show that $f(P) = 0$ for all $P \in \varphi(V')$. In fact,

$$f(P) = \widetilde{\varphi}(g)(P) = g(\varphi(P)) = 0$$

since $\varphi(V') \subseteq W'$ and $g \in I_W(W')$.

□

Proof of (b).

(1) Similar to Problem 2.3.

(2) Since φ is a polynomial map, there are polynomials $t_1, \ldots, t_m \in k[x_1, \ldots, x_n]$ such that
$$\varphi(P) = (t_1(P), \ldots, t_m(P)) \in W$$
for all $P \in V$. So that $\varphi|_{V'} : V' \to \varphi(V') \subseteq W'$ is also a polynomial map which is equipped with the same polynomials $t_1, \ldots, t_m$ such that
$$\varphi(P) = (t_1(P), \ldots, t_m(P)) \in W' \subseteq W$$
for all $P \in V' \subseteq V$. (Note that both V' and W' are affine varieties.)

□

Problem 2.10.*

Show that the ***projection map*** $\mathrm{pr} : \mathbf{A}^n \to \mathbf{A}^r$, $n \geq r$, *defined by* $\mathrm{pr}(a_1, \ldots, a_n) = (a_1, \ldots, a_r)$ *is a polynomial map.*

Proof.

(1) Define $t_i \in k[x_1, \ldots, x_n]$ by $t_i(x_1, \ldots, x_n) = x_i$ for $i = 1, \ldots, r$.

(2) Clearly,
$$\mathrm{pr}(P) = (t_1(P), \ldots, t_r(P))$$
for $P = (a_1, \ldots, a_n) \in \mathbf{A}^n$, and thus pr is a polynomial map.

□

Problem 2.11.

Let $f \in \Gamma(V)$, V *a variety* $\subseteq \mathbf{A}^n$. *Define*
$$G(f) = \{(a_1, \ldots, a_n, a_{n+1}) \in \mathbf{A}^{n+1} : (a_1, \ldots, a_n) \in V \text{ and } a_{n+1} = f(a_1, \ldots, a_n)\},$$
the ***graph*** *of* f. *Show that* $G(f)$ *is an affine variety, and that the map* $(a_1, \ldots, a_n) \mapsto (a_1, \ldots, a_n, f(a_1, \ldots, a_n))$ *defines an isomorphism of* V *with* $G(f)$. *(Projection gives the inverse.)*

Proof.

(1) Define $I = I(V)$ as an ideal in $k[x_1, \ldots, x_n]$. Note that

$$G(f) = V\underbrace{(I, x_{n+1} - f)}_{:=J}.$$

Here we can view I as an ideal of $k[x_1, \ldots, x_n, x_{n+1}]$.

(2) To show that $G(f)$ is an affine variety, it suffices to show that

$$I(G(f)) = I(V(J)) = \mathrm{rad}(J)$$

is prime (by Proposition 1 in §1.5 and the Hilbert's Nullstellensatz in §1.7). Suppose $gh \in I(G(f)) = \mathrm{rad}(J)$. Write

$$g = \sum_i g_i x_{n+1}^i = \sum_i g_i (\underbrace{(x_{n+1} - f)}_{\in J} + f)^i,$$
$$h = \sum_j h_j x_{n+1}^j = \sum_j h_j (\underbrace{(x_{n+1} - f)}_{\in J} + f)^j$$

where $g_i, h_j \in k[x_1, \ldots, x_n]$.

(3) Hence

$$\begin{aligned}
\mathrm{rad}(J) &= gh + \mathrm{rad}(J) && (gh \in \mathrm{rad}(J)) \\
&= (g + \mathrm{rad}(J))(h + \mathrm{rad}(J)) \\
&= \left(\sum_i g_i f^i + \mathrm{rad}(J)\right)\left(\sum_j h_j f^j + \mathrm{rad}(J)\right) && (x_{n+1} - f \in J) \\
&= \left(\sum_i g_i f^i\right)\left(\sum_j h_j f^j\right) + \mathrm{rad}(J)
\end{aligned}$$

or

$$\underbrace{\left(\sum_i g_i f^i\right)^N \left(\sum_j h_j f^j\right)^N}_{\in k[x_1, \ldots, x_n]} \in J = (I, x_{n+1} - f)$$

for some positive integer N. So that $\left(\sum_i g_i f^i\right)^N \left(\sum_j h_j f^j\right)^N \in I$.

(4) Since $I = I(V)$ is a prime ideal, we might get $\sum_i g_i f^i \in I \subseteq \mathrm{rad}(J)$. (The case $\sum_j h_j f^j$ is similar.) Hence $\mathrm{rad}(J) = I(G(f))$ is a prime ideal, or $G(f)$ is irreducible.

(5) As $G(f)$ is an affine variety, the map $\alpha : V \to G(f)$ defined by

$$\alpha : (a_1, \ldots, a_n) \mapsto (a_1, \ldots, a_n, f(a_1, \ldots, a_n))$$

is a polynomial map. (Here $t_1 = x_1, \ldots, t_n = x_n$ and $t_{n+1} = f$.)

(6) By Problem 2.10, the projection map pr is a polynomial map. Also note that $\mathrm{pr} \circ \alpha = 1_V$ and $\alpha \circ \mathrm{pr} = 1_{G(f)}$. Therefore, $V \cong G(f)$ as an affine variety isomorphism.

□

Problem 2.12.

(a) *Let $\varphi : \mathbf{A}^1 \to V = V(y^2 - x^3) \subseteq \mathbf{A}^2$ be defined by $\varphi(t) = (t^2, t^3)$. Show that although φ is a one-to-one, onto polynomial map, φ is not an isomorphism. (Hint: $\widetilde{\varphi}(\Gamma(V)) = k[t^2, t^3] \subsetneq k[t] = \Gamma(\mathbf{A}^1)$.)*

(b) *Let $\varphi : \mathbf{A}^1 \to V = V(y^2 - x^2(x+1))$ be defined by $\varphi(t) = (t^2 - 1, t(t^2 - 1))$. Show that φ is one-to-one and onto, except that $\varphi(\pm 1) = (0, 0)$.*

Proof of (a).

(1) Similar to Problem 2.8(a), φ is a polynomial map.

(2) Similar to Problem 2.8(a) again,

$$V = V(y^2 - x^3) = \{(t^2, t^3) \in \mathbf{A}^2(k) : t \in k\}.$$

Hence the map $\varphi : t \mapsto (t^2, t^3)$ is surjective.

(3) *Show that φ is injective.* Suppose $(t^2, t^3) = (s^2, s^3)$ for some $t, s \in k$. If $t = 0$, then $s = 0$. If $t \neq 0$, then $t = \frac{t^3}{t^2} = \frac{s^3}{s^2} = s$. In any case, $t = s$ whenever $(t^2, t^3) = (s^2, s^3)$.

(4) *Show that φ is not an isomorphism.* It suffices to show that $\widetilde{\varphi}(\Gamma(V)) \subsetneq \Gamma(\mathbf{A}^1)$ by Proposition 1. For any $f \in \Gamma(V)$,

$$\widetilde{\varphi}(f)(t) = (f \circ \varphi)(t) = f(t^2, t^3) \in k[t^2, t^3].$$

Hence,

$$\widetilde{\varphi}(\Gamma(V)) \subseteq k[t^2, t^3] \subsetneq k[t] = \Gamma(\mathbf{A}^1).$$

(Here note that $t \notin k[t^2, t^3]$ but $t \in k[t]$.)

□

Proof of (b).

(1) *Write*

$$Y = \{(t^2 - 1, t(t^2 - 1)) \in \mathbf{A}^2(k) : t \in k\}.$$

Show that $Y = V$. Similar to Problem 2.8(a). It suffices to show that $(x, y) \in Y$ for any $(x, y) \in V$. If $x = 0$, then $y = 0$ or $(x, y) = (0, 0) \in Y$

whenever $t = \pm 1$. (In fact, $(0,0) = (t^2-1, t(t^2-1))$ iff $t^2 - 1 = 0$ iff $t = \pm 1$ in any field.) If $x \neq 0$, define

$$t = \frac{y}{x} \in k.$$

So $y = tx$ and thus

$$0 = y^2 - x^2(x+1) = t^2x^2 - x^2(x+1) = x^2(t^2 - (x+1)).$$

Since $x \neq 0$ and k is a field, we have

$$t^2 - (x+1) = 0 \Longleftrightarrow x = t^2 - 1.$$

Hence, $y = tx = t(t^2-1)$ and therefore $(x,y) \in Y$.

(2) By (1), φ is surjective and $\varphi(\pm 1) = (0,0)$.

(3) *Show that φ is injective except that $\varphi(\pm 1) = (0,0)$.* Given $t, s \in k$. It suffices to show that $t = s$ whenever $(t^2-1, t(t^2-1)) = (s^2-1, s(s^2-1)) \neq (0,0)$. In fact, by assumption we have $t^2 - 1 = s^2 - 1 \neq 0$ by assumption. Therefore,

$$t = \frac{t(t^2-1)}{t^2-1} = \frac{s(s^2-1)}{s^2-1} = s.$$

□

Problem 2.13.

Let $V = V(x^2 - y^3, y^2 - z^3) \subseteq \mathbf{A}^3$ as in Problem 1.40, $\overline{\alpha} : \Gamma(V) \to k[t]$ induced by the homomorphism α of that problem.

(a) *What is the polynomial map f from $\mathbf{A}^1$ to V such that $\widetilde{f} = \overline{\alpha}$?*

(b) *Show that f is one-to-one and onto, but not an isomorphism.*

Proof of (a).

(1) *Write*

$$Y = \{(t^9, t^6, t^4) \in \mathbf{A}^3(k) : t \in k\}.$$

Show that $Y = V$. Similar to Problem 2.8(a). It suffices to show that $(x,y,z) \in Y$ for any $(x,y,z) \in V$. If $x = 0$, then $y = z = 0$ or $(x,y,z) = (0,0,0) \in Y$ by taking $t = 0$. If $x \neq 0$, define

$$t = \frac{yz}{x} \in k.$$

Hence,

$$t^9 = \frac{y^9 z^9}{x^9} = \frac{y^{15}}{x^9} = \frac{x^{10}}{x^9} = x,$$
$$t^6 = \frac{y^6 z^6}{x^6} = \frac{y^5 z^6}{x^6} y = \frac{y^9}{x^6} y = \frac{x^6}{x^6} y = y,$$
$$t^4 = \frac{y^4 z^4}{x^4} = \frac{y^4 z^3}{x^4} z = \frac{y^6}{x^4} z = \frac{x^4}{x^4} z = z.$$

(2) Define a mapping $f : \mathbf{A}^1 \to \mathbf{A}^3$ by

$$f : t \mapsto (t^9, t^6, t^4).$$

f is a polynomial map by construction. By (1), $f : \mathbf{A}^1 \to f(\mathbf{A}^1) = V$ and thus $\widetilde{f} = \overline{\alpha}$ by the definition of α.

□

Proof of (b).

(1) Similar to Problem 2.12(a).

(2) f is surjective by the proof of (a).

(3) *Show that f is injective.* Suppose $(t^9, t^6, t^4) = (s^9, s^6, s^4)$ for some $t, s \in k$. If $t = 0$, then $s = 0$. If $t \neq 0$, then $t = \frac{t^6 t^4}{t^9} = \frac{s^6 s^4}{s^9} = s$. In any case, $t = s$ whenever $(t^9, t^6, t^4) = (s^9, s^6, s^4)$.

(4) *Show that f is not an isomorphism.* It suffices to show that $\widetilde{f}(\Gamma(V)) \subsetneq \Gamma(\mathbf{A}^1)$ by Proposition 1. For any $g \in \Gamma(V)$,

$$\widetilde{f}(g)(t) = (g \circ f)(t) = g(t^9, t^6, t^4) \in k[t^4, t^6, t^9].$$

Hence,

$$\widetilde{\varphi}(\Gamma(V)) \subseteq k[t^4, t^6, t^9] \subsetneq k[t] = \Gamma(\mathbf{A}^1).$$

(Here note that $t \notin k[t^4, t^6, t^9]$ but $t \in k[t]$.)

□

2.3. Coordinate Changes

Problem 2.14.* (Linear subvariety)

*A set $V \subseteq \mathbf{A}^n(k)$ is called a **linear subvariety** of $\mathbf{A}^n(k)$ if $V = V(f_1, \ldots, f_r)$ for some polynomials f_i of degree 1.*

(a) *Show that if t is an affine change of coordinates on $\mathbf{A}^n(k)$, then V^t is also a linear subvariety of $\mathbf{A}^n(k)$.*

(b) *If $V \neq \varnothing$, show that there is an affine change of coordinates t of $\mathbf{A}^n$ such that $V^t = V(x_{m+1}, \ldots, x_n)$. (Hint: use induction on r.) So V is a variety.*

(c) *Show that the m that appears in part (b) is independent of the choice of t. It is called the dimension of V. Then V is then isomorphic (as a variety) to $\mathbf{A}^m(k)$. (Hint: Suppose there were an affine change of coordinates t such that $V(x_{m+1}, \ldots, x_n)^t = V(x_{s+1}, \ldots, x_n)$, $m < s$; show that $t_{m+1}, \ldots, t_n$ would be dependent.)*

Proof of (a).

(1) Say $t = (t_1, \ldots, t_n)$ is an affine change of coordinates, and $V = V(f_1, \ldots, f_r)$ for some polynomials f_i of degree 1.

(2) $V(f_1, \ldots, f_r)$ is the set of all solutions of the system of linear equations:

$$\begin{aligned} f_1 &= a_{11}x_1 + \cdots + a_{1n}x_n - b_1 = 0, \\ &\cdots \\ f_r &= a_{r1}x_1 + \cdots + a_{rn}x_n - b_r = 0. \end{aligned}$$

Write $Ax = b$ and $V = V(Ax = b)$ where

$$A = \underbrace{\begin{pmatrix} a_{11} & \cdots & a_{1n} \\ \vdots & \ddots & \vdots \\ a_{r1} & \cdots & a_{rn} \end{pmatrix}}_{\in \mathsf{M}_{r\times n}(k)}, \qquad x = \underbrace{\begin{pmatrix} x_1 \\ \vdots \\ x_n \end{pmatrix}}_{\in \mathsf{M}_{n\times 1}(k)}, \qquad b = \underbrace{\begin{pmatrix} b_1 \\ \vdots \\ b_r \end{pmatrix}}_{\in \mathsf{M}_{r\times 1}(k)}.$$

(3) Linear algebra says that Gaussian elimination transforms $(A|b)$ into its reduced row echelon form $(A'|b')$. Therefore, $V(Ax = b) = V(A'x = b')$.

(4) If $V(f_1, \ldots, f_r) = \varnothing$, nothing to do. If $V(f_1, \ldots, f_r) \neq \varnothing$, then

$$V(f_1, \ldots, f_r) = V(g_1, \ldots, g_m)$$

where $m = \operatorname{rank}(A)$ is the number of nonzero rows in A' ($m \leq r, n$) and $g_i = a'_{i1}x_1 + \cdots + a'_{in}x_n - b'_i$ for $1 \leq i \leq m$. (a'_{ij} is the entry of the matrix A'.)

(5) Now given any $f + I(V) \in k[x_1, \ldots, x_n]/I(V)$, we replace the leading term x_{i_1} of g_1 by $x_{i_1} - g_1$ to get

$$f + I(V) = f(x_1, \cdots, \underbrace{x_{i_1} - g_1}_{i_1\text{th position}}, \cdots, x_n) + I(V) := f_1 + I(V)$$

where $f_1 \in k[x_1, \ldots, \widehat{x_{i_1}} \ldots, x_n]$. Continue this process to replace each leading term x_{i_j} of g_j by $x_{i_j} - g_j$ to get one by one to get

$$\begin{aligned} f + I(V) &= f_1 + I(V) \text{ where } f_1 \in k[x_1, \ldots, \widehat{x_{i_1}} \ldots, x_n]. \\ &\cdots \\ f_{m-1} + I(V) &= f_m + I(V) \text{ where } f_m \in k[x_1, \ldots, \widehat{x_{i_1}}, \ldots, \widehat{x_{i_m}} \ldots, x_n]. \end{aligned}$$

Hence, a routine shows that there is a ring isomorphism

$$\alpha : k[x_1, \ldots, x_n]/I(V) \to \underbrace{k[x_1, \ldots, \widehat{x_{i_1}}, \ldots, \widehat{x_{i_m}} \ldots, x_n]}_{\text{a domain}}$$

sending f to f_m. Therefore, V is a variety.

(6) As $I(V) = (f_1, \ldots, f_r)$, $I(V)^t = (f_1^t, \ldots, f_r^t)$ where each f_i^t is linear. Thus $V^t = V(I(V)^t) = V(f_1^t, \ldots, f_r^t)$ is also a linear subvariety of $\mathbf{A}^n(k)$.

□

Proof of (b).

(1) Suppose $A \in \mathsf{M}_{r\times n}(k)$ is of rank $n-m$. Linear algebra says that there exist invertible matrices $B \in \mathsf{M}_{r\times r}(k)$ and $C \in \mathsf{M}_{n\times n}(k)$ such that $D = BAC$, where

$$D = BAC = \underbrace{\begin{pmatrix} O_1 & O_2 \\ O_3 & I_{n-m} \end{pmatrix}}_{\in \mathsf{M}_{r\times n}(k)}$$

in which $I_{n-m} \in \mathsf{M}_{(n-m)\times(n-m)}(k)$ is the identity matrix and O_1, O_2, and O_3 are zero matrices.

(2) Let t' be the linear map corresponding to the matrix C. So

$$\begin{aligned} V^{t'} &= V(Ax = b)^{t'} \\ &= V(ACx = b) \\ &= V(BACx = Bb) && (B\text{: invertible}) \\ &= V(Dx = Bb) \\ &= V(-\beta_1, \cdots, -\beta_m, x_{m+1} - \beta_{m+1}, \cdots, x_n - \beta_n) && (V \neq \varnothing) \\ &= V(x_{m+1} - \beta_{m+1}, \cdots, x_n - \beta_n) \end{aligned}$$

where $Bb = \underbrace{\begin{pmatrix} \beta_1 \\ \vdots \\ \beta_n \end{pmatrix}}_{\in \mathsf{M}_{n\times 1}(k)}$.

(3) Let t'' be the translation corresponding to the matrix Bb. Let $t = t'' \circ t'$ be the desired affine change of coordinates. Therefore,

$$\begin{aligned} V^t &= (V^{t'})^{t''} \\ &= V(x_{m+1} - \beta_{m+1}, \cdots, x_n - \beta_n)^{t''} \\ &= V(x_{m+1}, \cdots, x_n). \end{aligned}$$

□

Proof of (c).

(1) Linear algebra says that the rank of any matrix is the maximal number of its linearly independent rows, which is uniquely determined. Therefore, $\dim(V) = n - \operatorname{rank}(A|b) = n - \operatorname{rank}(A'|b')$ is uniquely determined.

(2) V is then isomorphic to $\mathbf{A}^m(k)$ as a variety.

□

Problem 2.15.* (Line)

*Let $P = (a_1, \ldots, a_n)$, $Q = (b_1, \ldots, b_n)$ be distinct points of $\mathbf{A}^n$. The **line** through P and Q is defined to be $\{(a_1 + t(b_1 - a_1), \ldots, a_n + t(b_n - a_n)) : t \in k\}$.*

(a) *Show that if L is the line through P and Q, and t is an affine change of coordinates, then $t(L)$ is the line through $t(P)$ and $t(Q)$.*

(b) *Show that a line is a linear subvariety of dimension 1, and that a linear subvariety of dimension 1 is the line through any two of its points.*

(c) *Show that, in $\mathbf{A}^2$, a line is the same thing as a hyperplane.*

(d) *Let $P, P' \in \mathbf{A}^2$, L_1, L_2 two distinct lines through P, L_1', L_2' distinct lines through P'. Show that there is an affine change of coordinates t of $\mathbf{A}^2$ such that $t(P) = P'$ and $t(L_i) = L_i'$, $i = 1, 2$.*

Proof of (a).

(1) Write $t = (t_1, \ldots, t_n)$ as

$$t_i = \sum_j c_{ij} x_j + c_{i0}.$$

Take any point $\alpha_s = (a_1 + s(b_1 - a_1), \ldots, a_n + s(b_n - a_n)) \in L$ for some $s \in k$. (In particular, $P_0 = P$ and $P_1 = Q$.)

(2) As

$$\begin{aligned} t_i(P_s) &= \sum_j c_{ij}(a_j + s(b_j - a_j)) + c_{i0} \\ &= \left(\sum_j c_{ij}a_j + c_{i0}\right) \\ &\quad + s\left[\left(\sum_j c_{ij}b_j + c_{i0}\right) - \left(\sum_j c_{ij}a_j + c_{i0}\right)\right] \\ &= t_i(P) + s(t_i(Q) - t_i(P)), \end{aligned}$$

we have

$$\begin{aligned} t(L) = \{&(t_1(P) + s(t_1(Q) - t_1(P)), \dots, \\ &t_n(P) + s(t_n(Q) - t_n(P))) : s \in k\}. \end{aligned}$$

Moreover, $t(P) \in t(L)$ as $s = 0$ and $t(Q) \in t(L)$ as $s = 1$. Therefore, $t(L)$ is the line through $t(P)$ and $t(Q)$.

□

Proof of (b).

(1) Note that $a_j \neq b_j$ for some $1 \leq j \leq n$ since $P \neq Q$. Write

$$L = V\left(x_i = a_i + \frac{x_j - a_j}{b_j - a_j}(b_i - a_i)\right)$$

for $1 \leq i \leq n$ and $i \neq j$. By Problem 2.14, L is a linear subvariety.

(2) Note that

$$\begin{aligned} n - \dim(L) &= \text{the rank of the corresponding augmented matrix } (A'|b') \\ &= \text{the maximal number of the linearly independent rows of } (A'|b') \\ &= n - 1, \end{aligned}$$

which is uniquely determined. Therefore, $\dim(V) = 1$.

(3) Conversely, $\dim(V) = 1$ implies that $\operatorname{rank}(A'|b') = n - 1$. So all leading terms are all x_i except only one x_j for some j. Hence V is of the form

$$V = (x_i + a_{ij}x_j = b_i)$$

for $1 \leq i \leq n$ and $i \neq j$. So

$$\begin{aligned} V &= \{(b_1 - a_{1j}s, \dots, \underbrace{s}_{j\text{th position}}, \dots, b_n - a_{nj}s) : s \in k\} \\ &= \{(b_1 + s((b_1 - a_{1j}) - b_1), \dots, \underbrace{0 + s(1 - 0)}_{j\text{th position}}, \dots, \\ &\qquad (b_n + s((b_n - a_{nj}) - b_n) : s \in k\} \end{aligned}$$

is a line passing

$$P = (b_1, \ldots, 0, \ldots, b_n)$$
$$Q = (b_1 - a_{1j}, \ldots, 1, \ldots, b_n - a_{nj})$$

with $P \neq Q$ (since they are different in the jth position). (Here we can change P and Q to any two different points on V.)

□

Proof of (c).

(1) A line $L \subseteq \mathbf{A}^2$ is $V(x + ay = b)$ or $V(x + ay = b)$ by (b). In any case, L is a hyperplane in $\mathbf{A}^2$.

(2) Conversely, given any hyperplane $V = V(ax + by + c = 0) \subseteq \mathbf{A}^2$ where a and b are not all zero. Might assume that $a \neq 0$. (The case $b \neq 0$ is similar.) So

$$V = \left\{ \left(-\frac{c}{a} - \frac{b}{a}s, s \right) : s \in k \right\}$$

is a line passing $\left(-\frac{c}{a}, 0\right)$ and $\left(-\frac{c+b}{a}, 1\right)$.

□

Proof of (d).

(1) It suffices to show that there is a bijective affine change of coordinates t of $\mathbf{A}^2$ such that $t(P) = (0, 0)$, $t(L_1) = V(x = 0)$ and $t(L_2) = V(y = 0)$. Write $P = (p_1, p_2)$ and $L_i = a_i x + b_i y + c_i$ for $i = 1, 2$.

(2) Let $t'' = (t''_1, t''_2)$ be a translation defined by

$$\begin{pmatrix} t''_1 \\ t''_2 \end{pmatrix} = \begin{pmatrix} x - p_1 \\ y - p_2 \end{pmatrix}.$$

So ${L_1}^{t''} = a_1 x + b_1 y$ and ${L_2}^{t''} = a_2 x + b_2 y$. Let

$$A = \begin{pmatrix} a_1 & b_1 \\ a_2 & b_2 \end{pmatrix}$$

and $t' = (t'_1, t'_2)$ be a linear map defined by

$$\begin{pmatrix} t'_1 \\ t'_2 \end{pmatrix} = \frac{1}{\det(A)} \begin{pmatrix} b_2 & -b_1 \\ -a_2 & a_1 \end{pmatrix} \begin{pmatrix} x \\ y \end{pmatrix}.$$

(t' is well-defined since L_1 and L_2 are distinct lines and thus $\det(A) \neq 0$.) Write $t = (t_1, t_2) = t' \circ t''$. So

$$\begin{pmatrix} t_1 \\ t_2 \end{pmatrix} = \frac{1}{\det(A)} \begin{pmatrix} b_2 & -b_1 \\ -a_2 & a_1 \end{pmatrix} \begin{pmatrix} x - p_1 \\ y - p_2 \end{pmatrix}$$

and

$$L_1^t = ({L_1}^{t''})^{t'} = x$$
$$L_2^t = ({L_2}^{t''})^{t'} = y.$$

(3) Conversely, define an affine change of coordinates $s = (s_1, s_2)$ of $\mathbf{A}^2$ by

$$\begin{pmatrix} s_1 \\ s_2 \end{pmatrix} = \begin{pmatrix} a_1x + b_1y + c_1 \\ a_2x + b_2y + c_2 \end{pmatrix}$$

so that $x^s = L_1$ and $y^s = L_2$.

(4) By (2)(3), the statement in (1) is established.

□

Problem 2.16.

Let $k = \mathbb{C}$. Give $\mathbf{A}^n(\mathbb{C}) = \mathbb{C}^n$ the usual topology (obtained by identifying $\mathbb{C}$ with $\mathbb{R}^2$, and hence $\mathbb{C}^n$ with $\mathbb{R}^{2n}$). Recall that a topological space X is path-connected if for any $P, Q \in X$, there is a continuous mapping $\gamma : [0,1] \to X$ such that $\gamma(0) = P$, $\gamma(1) = Q$.

(a) *Show that $\mathbb{C} - S$ is path-connected for any finite set S.*

(b) *Let V be an algebraic set in $\mathbf{A}^n(\mathbb{C})$. Show that $\mathbf{A}^n(\mathbb{C}) - V$ is path-connected. (Hint: If $P, Q \in \mathbf{A}^n(\mathbb{C}) - V$, let L be the line through P and Q. Then $L \cap V$ is finite, and L is isomorphic to $\mathbf{A}^1(\mathbb{C})$.)*

Proof of (a).

(1) Regard $\mathbb{C}^n$ as $\mathbb{R}^{2n}$. Given any $P, Q \in \mathbb{C}^n - S$. Write $S := \{P_1, \ldots, P_m\} \subseteq \mathbb{C}^n$.

(2) Let L_{P_i} (resp. L'_{P_i}) be a line passing P (resp. Q) and P_i for every $P_i \in S$. (It is well-defined since P, Q are not in S.) So $\mathscr{C} := \{L_{P_i} : P_i \in S\}$ (resp. $\mathscr{C}' := \{L'_{P_i} : P_i \in S\}$) is a collection of finitely many lines.

(3) Consider a unit sphere $\mathbb{S}^{2n-1}(P)$ centered at P.

$$\left(\bigcup_{L_i \in \mathscr{C}} L_i \right) \bigcap \mathbb{S}^{2n-1}(P)$$

is again a finite set (of order $\leq 2|S| = 2m$). Since $\mathbb{S}^{2n-1}$ is infinite, we can always take a line L passing P and some point in $\mathbb{S}^{2n-1}(P)$ where $L \cap S = \varnothing$.

(4) Similarly, we take a line L' passing Q and some point in $\mathbb{S}^{2n-1}(Q)$ where $L' \cap S = \varnothing$ and $L' \cap L \neq \varnothing$. (There are only two points in $\mathbb{S}^{2n-1}(Q)$ such that $L' \cap L = \varnothing$. Note that $\mathbb{S}^{2n-1}$ is infinite.)

(5) Take any point $A \in L' \cap L$. So there is a path from P to A (on a segment containted in L) and then to Q (on a segment containted in L'). Therefore, $\mathbb{C}^n - S$ is path-connected.

□

Proof of (b).

(1) Given any $P, Q \in \mathbf{A}^n(\mathbb{C}) - V$. Let L be the line through P and Q. To show $\mathbf{A}^n(\mathbb{C}) - V$ is path-connected, it suffices to show that

$$L - V = L - (V \cap L)$$

is path-connected.

(2) Similar to Problem 1.12, we have $V \cap L$ is finite. In fact, write $V = (f_1, \ldots, f_r)$ and $L = \{(a_1 + t(b_1 - a_1), \ldots, a_n + t(b_n - a_n)) : t \in k\}$ where $P = (a_1, \ldots, a_n)$ and $Q = (b_1, \ldots, b_n)$. Then

$$\begin{aligned} V \cap L &= \bigcap_i (V(f_i) \cap L) \\ &= \bigcap_i \{f_i(a_1 + t(b_1 - a_1), \ldots, a_n + t(b_n - a_n)) = 0 : t \in k\} \\ &= \bigcap_i \text{ finite set} \\ &= \text{finite set.} \end{aligned}$$

Here $f_i(a_1 + t(b_1 - a_1), \ldots, a_n + t(b_n - a_n))$ is a nonzero polynomial since $P, Q \notin V(f_i)$.

(3) Note that the path-connectedness is a topological invariant under homeomorphisms. Since any line is homeomorphic to $\mathbb{C}^1$, $L - V$ is homeomorphic to $\mathbb{C}^1 - S$ for some finite set S (by (2)). By (a), $L - V$ is path-connected and so is $\mathbf{A}^n(\mathbb{C}) - V$.

□

2.4. Rational Functions and Local Rings

Problem 2.17.

Let $V = V(y^2 - x^2(x+1)) \subseteq \mathbf{A}^2$, and $\overline{x}, \overline{y}$ the residues of x, y in $\Gamma(V)$; let $z = \overline{y}/\overline{x} \in k(V)$. Find the pole sets of z and of z^2.

Proof.

(1) *Show that the pole set of z is $\{(0,0)\}$.*

(a) Since V is irreducible by Problem 2.12(b), V is a variety. Note that the pole set of z is

$$\bigcap_{z=\overline{f}/\overline{g}} V(\overline{g}).$$

(b) By (a), $\{(0,0)\}$ contains the the pole set of z. (As the denominator $x=0$, we solve the equation $y^2-x^2(x+1)=0$ to get $y=0$.)

(c) (Reductio ad absurdum) If $(0,0)$ were not a pole, then there were $\overline{f},\overline{g}\in\Gamma(V)$ such that $z=\overline{y}/\overline{x}=\overline{f}/\overline{g}$ where $\overline{g}(0,0)\neq 0$. So

$$\begin{aligned}
& z=\overline{y}/\overline{x}=\overline{f}/\overline{g}\\
\Longrightarrow\ & \overline{xf}=\overline{yg}\\
\Longrightarrow\ & xf-yg\in(y^2-x^2(x+1))\\
\Longrightarrow\ & xf-yg=h(y^2-x^2(x+1)) \text{ for some } h\\
\Longrightarrow\ & y(g+hy)=x(f+hx(x+1))\in(x)\\
\Longrightarrow\ & g+hy\in(x)\\
\Longrightarrow\ & g(0,0)=0,
\end{aligned}$$

which is absurd.

(2) *Show that the pole set of z^2 is empty.* Note that $z^2=\overline{y^2}/\overline{x^2}=\overline{x+1}$. So the pole set of z^2 is

$$\bigcap_{z^2=\overline{f}/\overline{g}} V(\overline{g})=\varnothing.$$

□

2.5. Discrete Valuation Rings

Problem 2.23.*

Show that the order function on K is independent of the choice of uniformizing parameter.

Proof.

(1) *Show that a uniformizing parameter is unique up to a unit.* Suppose t and t' are two uniformizing parameters for a discrete valuation ring R with the quotient field K. Since R is a DVR, the maximal ideal is

$$\mathfrak{m}=(t)=(s).$$

As $s \in (t)$, there is an element $a \in R$ such that $s = at$. As s is irreducible (by the maximality of $\mathfrak{m}$), a is a unit or t is a unit (which is impossible). Hence $s = at$ for some unit $a \in R$.

(2) For any $z \in K$, write

$$z = ut^n = vs^m$$

for some units u, v and integers $n \geq m$. (The case $n \leq m$ is similar.) Replace $s = at$ to get $ut^n = va^m t^m$. So $t^{n-m} = u^{-1}va^m$ is a unit. Hence, $m = n$, or the order function on K is independent of the choice of uniformizing parameter.

□

Problem 2.24.*

Let $V = \mathbf{A}^1$, $\Gamma(V) = k[x]$, $K = k(V) = k(x)$.

(a) *For each $a \in k = V$, show that $\mathcal{O}_a(V)$ is a DVR with uniformizing parameter $t = x - a$.*

(b) *Show that $\mathcal{O}_\infty = \{f/g \in k(x) : \deg(g) \geq \deg(f)\}$ is also a DVR, with uniformizing parameter $t = 1/x$.*

Proof of (a).

(1) By Proposition 7 in §2.4, $\mathcal{O}_a(V)$ is a (Noetherian) local domain. It suffices to show that $t = x - a$ is an irreducible element in $\mathcal{O}_a(V)$ such that every nonzero $z \in \mathcal{O}_a(V)$ might be written uniquely in the form $z = ut^n$, u a unit in $\mathcal{O}_a(V)$, n a nonnegative integer (by Proposition 4).

(2) Write $z = f/g \in \mathcal{O}_a(V)$ where $g(a) \neq 0$. By Problem 1.7,

$$f = \sum_{i=0}^{\deg(f)} \lambda_i (x-a)^i.$$

Let n be the smallest integer such that $\lambda_n \neq 0$. (Such n is existed since z or f is nonzero.) Hence, $f = f_1(x-a)^n$ where $f_1 = \sum_{i=n}^{\deg(f)} \lambda_i (x-a)^{i-n} \neq 0$ and $f_1(a) = \lambda_n \neq 0$. So

$$z = f/g = (f_1/g)(x-a)^n.$$

Here f_1/g is a unit in $\mathcal{O}_a(V)$. Besides, it is easy to show that n is unique by the similar argument in Problem 2.23. Hence, $\mathcal{O}_a(V)$ is a DVR with uniformizing parameter $t = x - a$.

□

Proof of (b).

(1) *Show that $\mathcal{O}_\infty$ is a subring of $k(x)$.* Clearly, $1 = 1/1 \in \mathcal{O}_\infty$. Also, given any $f = a/b, g = c/d \in \mathcal{O}_\infty$. So

$$f - g = a/b - c/d = \frac{ad - bc}{bd} \in \mathcal{O}_\infty$$
$$fg = a/b \cdot c/d = \frac{ac}{bd} \in \mathcal{O}_\infty$$

since

$$\begin{aligned}\deg(ad - bc) &\leq \max(\deg(ad), \deg(bc)) \\ &\leq \max(\deg(a) + \deg(d), \deg(b) + \deg(c)) \\ &\leq \max(\deg(b) + \deg(d), \deg(b) + \deg(d)) \\ &\leq \deg(b) + \deg(d) \\ &\leq \deg(bd)\end{aligned}$$

and

$$\deg(ac) = \deg(a) + \deg(c) \leq \deg(b) + \deg(d) = \deg(bd).$$

(Here we define $\deg(0) = -\infty$ by convention.) By the subring test, $\mathcal{O}_\infty$ is a subring of $k(x)$.

(2) *Show that $\mathcal{O}_\infty$ is a DVR.* Clearly $\mathcal{O}_\infty$ is not a field since $1/x \in \mathcal{O}_\infty$ but $x = x/1 \notin \mathcal{O}_\infty$. Let $t = 1/x$ be an irreducible element of $\mathcal{O}_\infty$. ($\deg(x) = 1$ implies the irreducibility of t.) Now for any nonzero $f/g \in \mathcal{O}_\infty$, write

$$f/g = ((fx^n)/g)(1/x^n) = ((fx^n)/g)t^n$$

where $n := \deg(g) - \deg(f) \geq 0$. Note that $\deg(fx^n) = \deg(f) + n = \deg(g)$. So $(fx^n)/g$ is a unit since the inverse $g/(fx^n)$ is also in $\mathcal{O}_\infty$. Besides, it is easy to show that n is unique by the similar argument in Problem 2.23. Hence, $\mathcal{O}_\infty$ is a DVR.

□

Note.

(1) The quotient field of $\mathcal{O}_\infty$ is $K = k(V) = k(x)$.

(2) The set of units in $\mathcal{O}_\infty(V)$ is $\{f/g \in k(x) : \deg(g) = \deg(f)\}$.

(3) The maximal ideal of $\mathcal{O}_\infty(V)$ is $\{f/g \in k(x) : \deg(g) > \deg(f)\}$.

Problem 2.25. (p-adic integers)

Let $p \in \mathbb{Z}$ be a prime number. Show that

$$\{r \in \mathbb{Q} : r = a/b,\ a, b \in \mathbb{Z},\ p \text{ doesn't divide } b\}$$

is a DVR with quotient field $\mathbb{Q}$.

Proof.

(1) Let
$$\mathbb{Z}_p = \{r \in \mathbb{Q} : r = a/b,\ a, b \in \mathbb{Z},\ p \nmid b\}$$
be the set of all p-adic integers.

(2) *Show that $\mathbb{Z}_p$ is a subring of $\mathbb{Q}$.* Clearly, $1 = 1/1 \in \mathbb{Z}_p$ (since $p \nmid 1$). Also, given any $r = a/b, s = c/d \in \mathbb{Z}_p$. So
$$r - s = a/b - c/d = \frac{ad - bc}{bd} \in \mathbb{Z}_p$$
$$rs = a/b \cdot c/d = \frac{ac}{bd} \in \mathbb{Z}_p$$
since $p \nmid b$, $p \nmid d$ and p is a prime number. By the subring test, $\mathbb{Z}_p$ is a subring of $\mathbb{Q}$.

(3) Note that $\mathbb{Z}_p \subseteq \mathbb{Q}$ is a domain and $\mathbb{Z}_p$ is not a field (since $p = p/1 \in \mathbb{Z}_p$ but $p^{-1} = 1/p \notin \mathbb{Z}_p$).

(4) Let $t = p$ be an irreducible element in $\mathbb{Z}_p$. For the irreducibility of $t = p$, we write $p = a/b \cdot c/d = \frac{ac}{bd}$ where $p \nmid b$, $p \nmid d$. So $pbd = ac$ or
$$1 = \mathrm{ord}_p(ac) = \mathrm{ord}_p(a) + \mathrm{ord}_p(c).$$
Here $\mathrm{ord}_p : \mathbb{Z} \to \mathbb{Z}_{\geq 0}$ is defined by $\mathrm{ord}_p(a) = n$ where n is the largest number such that p^n divides a, that is, $p^n \mid a$ and $p^{n+1} \nmid a$. So $(\mathrm{ord}_p(a), \mathrm{ord}_p(c)) = (0, 1)$ or $(1, 0)$. Hence, a/b or c/d is a unit in $\mathbb{Z}_p$, or p is irreducible in $\mathbb{Z}_p$.

(5) For any nonzero $r = a/b \in \mathbb{Z}_p$, $a \neq 0$ can be written as $a = p^n c$ for some nonnegative integer n and $c \in \mathbb{Z}^+$ uniquely. Hence
$$r = a/b = (c/b)p^n = (c/b)t^n,$$
where c/b is a unit and n is a nonnegative integer. Besides, it is easy to show that n is unique by the similar argument in Problem 2.23. By Proposition 4, $\mathbb{Z}_p$ is a DVR.

(6) *Show that the quotient field of $\mathbb{Z}_p$ is $\mathbb{Q}$.* It suffices to show that r is in the quotient field of $\mathbb{Z}_p$ if $r \in \mathbb{Q} - \mathbb{Z}_p$. Note that $r \neq 0$. Write $r = a/b$ with $\gcd(a, b) = 1$. As $r \notin \mathbb{Z}_p$, $p \mid b$ and $p \nmid a$. Therefore, $1/r = b/a \in \mathbb{Z}_p$, or r is in the quotient field of $\mathbb{Z}_p$.

□

Note.

(1) $p\mathbb{Z}_p$ is the maximal ideal of $\mathbb{Z}_p$.

(2) The residue field $\mathbb{Z}_p/p\mathbb{Z}_p \cong \mathbb{Z}/p\mathbb{Z}$.

Problem 2.26.*

Let R be a DVR with quotient field K; let $\mathfrak{m}$ be the maximal ideal of R.

(a) *Show that if $z \in K$, $z \notin R$, then $z^{-1} \in \mathfrak{m}$.*

(b) *Suppose $R \subseteq S \subseteq K$, and S is also a DVR. Suppose the maximal ideal of S contains $\mathfrak{m}$. Show that $S = R$.*

Proof of (a).

(1) Suppose t is one uniformizing parameter for R. If $z \in K - R$, then we can write $z = ut^{-n}$ for some unit $u \in R$ and $n \in \mathbb{Z}^+$.

(2) Hence,
$$z^{-1} = u^{-1}t^n.$$
Since u^{-1} is a unit in R and $n > 0$, $z^{-1} \in \mathfrak{m}$.

□

Proof of (b).

(1) (Reductio ad absurdum) Suppose $z \in S - R \subseteq K - R$. By (a), $z^{-1} \in \mathfrak{m}$. So z^{-1} is in the maximal ideal $\mathfrak{m}'$ of S containing $\mathfrak{m}$.

(2) As $\mathfrak{m}'$ is an ideal, $1 = z \cdot z^{-1} \in \mathfrak{m}'$, which is absurd. Therefore, $S = R$.

□

Problem 2.27.

Show that the DVR's of Problem 2.24 are the only DVR's with quotient field $k(x)$ that contain k. Show that those of Problem 2.25 are the only DVR's with quotient field $\mathbb{Q}$.

Proof (Problem 2.26).

(1) *Show that $\mathcal{O}_a(V)$ and $\mathcal{O}_\infty$ are the only DVR's with quotient field $k(x)$ that contain k.*

(a) Let $k \subseteq R \subsetneq k(x)$ be a DVR with quotient field $k(x)$, $\mathfrak{m}$ be the unique maximal ideal of R. $\mathfrak{m} \neq (0)$ and the set of units in R is $R - \mathfrak{m}$.

(b) There are two possible cases: $x \in R$ or $x \notin R$.

(c) Suppose $x \in R$. So R contains $k[x]$ as a subring. Consider the subset

$$S := \{x - a \in k[x] : a \in k\} \cap \mathfrak{m} \subseteq \mathfrak{m}.$$

Suppose there were two distinct elements $x - a, x - b \in S$. Then $1 \in \mathfrak{m}$, contrary to the maximality of $\mathfrak{m}$. Suppose $S = \varnothing$, then every $x - a$ is a unit in R. Since $k = \overline{k}$, $R = k(x)$ is a field, which is absurd. Hence, there is only one $x - a \in \mathfrak{m}$ for one unique $a \in k$ and other $x - b$ with $b \neq a$ is a unit in R. Thus, $R \supseteq \mathcal{O}_a(V)$ and $\mathfrak{m}$ contains $(x - a)\mathcal{O}_a(V)$, which is the maximal ideal of $\mathcal{O}_a(V)$. By Problem 2.26, $R = \mathcal{O}_a(V)$.

(d) If $x \notin R$, then $x - a \notin R$ whenever $a \in k \subseteq R$. Hence $(x - a)^{-1} \in \mathfrak{m}$ whenever $a \in k$ by Problem 2.26(a). Next, given any $f/g \in \mathcal{O}_\infty$, by $k = \overline{k}$ we have

$$f/g = \underbrace{u}_{\in k} \underbrace{\frac{x - \alpha_1}{x - \beta_1}}_{\in R} \cdots \underbrace{\frac{x - \alpha_n}{x - \beta_n}}_{\in R} \underbrace{\frac{1}{x - \beta_{n+1}}}_{\in \mathfrak{m}} \cdots \underbrace{\frac{1}{x - \beta_m}}_{\in \mathfrak{m}},$$

where $n := \deg(f)$, $m := \deg(g)$ and $n \leq m$. Here

$$\frac{x - \alpha_i}{x - \beta_i} = \underbrace{1}_{\in k} + \underbrace{\frac{\beta_i - \alpha_i}{x - \beta_i}}_{\in \mathfrak{m} \subseteq R} \in R.$$

Therefore, $R \supseteq \mathcal{O}_\infty$ and $\mathfrak{m}$ contains the maximal ideal $x^{-1}\mathcal{O}_\infty$ of $\mathcal{O}_\infty$. By Problem 2.26, $R = \mathcal{O}_\infty$.

(2) *Show that $\mathbb{Z}_p$ are the only DVR's with quotient field $\mathbb{Q}$.*

(a) Let $R \subsetneq \mathbb{Q}$ be a DVR with quotient field $\mathbb{Q}$, $\mathfrak{m}$ be the unique maximal ideal of R. $\mathfrak{m} \neq (0)$ and the set of units in R is $R - \mathfrak{m}$.

(b) Note that $R \subseteq \mathbb{Q}$ contains $\mathbb{Z}$ as a subring. Consider the subset

$$S := \{p \in \mathbb{Z} : p \text{ is a prime number}\} \cap \mathfrak{m} \subseteq \mathfrak{m}.$$

(c) Suppose there were two distinct prime integers $p, q \in S$. By the Bézout's identity, there exist integers a and b such that $pa + qb = 1$. $1 \in \mathfrak{m}$, contrary to the maximality of $\mathfrak{m}$.

(d) Suppose no prime integer were in S, then every prime integer is a unit in R. By the fundamental theorem of arithmetic, $R = \mathbb{Q}$ is a field, which is absurd.

(e) By (c)(d), $p \in \mathfrak{m}$ for one unique prime $p \in \mathbb{Z}$. Thus, $R \supseteq \mathbb{Z}_p$ by the definition of $\mathbb{Z}_p$ and $\mathfrak{m}$ contains $p\mathbb{Z}_p$, which is the maximal ideal of $\mathbb{Z}_p$. By Problem 2.26, $R = \mathbb{Z}_p$.

□

Problem 2.28.*

An order function on a field K is a function φ from K onto $\mathbb{Z} \cup \{\infty\}$, satisfying:

(i) $\varphi(a) = \infty$ *if and only if* $a = 0$.

(ii) $\varphi(ab) = \varphi(a) + \varphi(b)$.

(iii) $\varphi(a + b) \geq \min(\varphi(a), \varphi(b))$.

Show that $R = \{z \in K : \varphi(z) \geq 0\}$ is a DVR with maximal ideal $\mathfrak{m} = \{z \in K : \varphi(z) > 0\}$, and quotient field K. Conversely, show that if R is a DVR with quotient field K, then the function ord $: K \to \mathbb{Z} \cup \{\infty\}$ *is an order function on K. Giving a DVR with quotient field K is equivalent to defining an order function on K.*

Proof.

(1) *Show that* $\varphi(1) = 0$. Note that $\varphi(1) = \varphi(1 \cdot 1) = \varphi(1) + \varphi(1)$ by (ii). By Property (i) of φ, we cancel $\varphi(1) \in \mathbb{Z}$ on the both side to get $\varphi(1) = 0$.

(2) *Show that* $\varphi(-z) = \varphi(z)$ *for all* $z \in K$, *and* $\varphi(z^{-1}) = -\varphi(z)$ *for all* $z \in K - \{0\}$. Note that $\varphi(-1) = 0$ since $0 = \varphi(1) = \varphi((-1) \cdot (-1)) = \varphi(-1) + \varphi(-1)$ (by (1)). Therefore,

$$\varphi(-z) = \varphi((-1) \cdot z) = \varphi(-1) + \varphi(z) = \varphi(z).$$

Besides,

$$0 = \varphi(1) = \varphi(zz^{-1}) = \varphi(z) + \varphi(z^{-1})$$

if $z \neq 0$. So $\varphi(z^{-1}) = -\varphi(z)$ if $z \neq 0$.

(3) *Show that* $R = \{z \in K : \varphi(z) \geq 0\}$ *is a ring.*

(a) $R \neq \varnothing$ since $1 \in R$.

(b) If $a, b \in R$, then

$$\varphi(a - b) \geq \min(\varphi(a), \varphi(-b)) = \min(\varphi(a), \varphi(b)) \geq 0$$

(by (2)), or $a - b \in R$.

(c) If $a, b \in R$, then $\varphi(ab) = \varphi(a) + \varphi(b) \geq 0$.

By the subring test, R is a subring of K.

(4) *Show that* $\{z \in K - \{0\} : \varphi(z) = 0\}$ *is the set of all units in* R. Given any $z \in K - \{0\}$, we have

$$0 = \varphi(z) + \varphi(z^{-1})$$

(by (2)). Hence z is a unit in R iff $z, z^{-1} \in R$ iff $\varphi(z) = \varphi(z^{-1}) = 0$.

(5) *Show that* $\mathfrak{m} = \{z \in K : \varphi(z) > 0\}$ *is a maximal ideal of* R.

(a) If $a, b \in \mathfrak{m}$, then $\varphi(a + b) \geq \min(\varphi(a), \varphi(b)) > 0$.

(b) If $a \in \mathfrak{m}$ and $r \in R$, then $\varphi(ra) = \varphi(r) + \varphi(a) \geq \varphi(a) > 0$.

(c) By (a)(b), $\mathfrak{m}$ is an ideal of R.

(d) Note that each proper ideal in R does not have any unit, that is, such proper ideal is contained in $\{z \in K : \varphi(z) > 0\} = \mathfrak{m}$ exactly (by (4)). Therefore, $\mathfrak{m}$ is maximal. (Such maximal ideal $\mathfrak{m}$ is unique and thus R is a local ring.)

(6) *Show that* R *is a DVR.* It suffices to show that there is an irreducible element $t \in R$ such that every nonzero $z \in R$ may be written uniquely in the form $z = ut^n$, u a unit in R, n a nonnegative integer. Since φ is surjective, there is an element $t \in R$ such that $\varphi(t) = 1$. Note that $t \neq 0$ and irreducible (by using Property (ii) of φ). Hence for any nonzero $z \in R$ with $n := \varphi(z) \in \mathbb{Z}$ and $n \geq 0$, the order of $zt^{-n} \in K$ is

$$\varphi(zt^{-n}) = \varphi(z) - n\varphi(t) = n - n \cdot 1 = 0$$

(by (2)). That is, $zt^{-n} = u$ is a unit in R (by (4)). Hence $z = ut^n$ for some unit $u \in R$ and nonnegative integer n. Note that n is uniquely determined by $\varphi(z)$. By Proposition 4, R is a DVR.

(7) *Show that the quotient field of* R *is* K. Since R is a DVR, the quotient field of R is contained in K. Conversely, given any $z \in K$. If $\varphi(z) \geq 0$, then $z \in R \subseteq K$. If $\varphi(z) < 0$, then $\varphi(z^{-1}) = -\varphi(z) > 0$ or $z^{-1} \in R$. Hence $z = 1/z^{-1} \in K$ is in the quotient field of R.

(8) *Show that giving a DVR with quotient field* K *is equivalent to defining an order function on* K. It suffices to show that $\mathrm{ord}(\cdot)$ on K defines an order function φ on K. By Problem 2.29, it suffices to show that

$$\mathrm{ord}(a + b) \geq \min(\mathrm{ord}(a), \mathrm{ord}(b))$$

if $\mathrm{ord}(a) = \mathrm{ord}(b) := n$. Write $a = ut^n, b = vt^n$ where u, v are units in R. Hence,

$$\begin{aligned}
\mathrm{ord}(a + b) &= \mathrm{ord}(ut^n + vt^n) \\
&= \mathrm{ord}((u + v)t^n) \\
&= \mathrm{ord}(u + v) + n \\
&\geq n && (u + v \in R) \\
&= \min(\mathrm{ord}(a), \mathrm{ord}(b)).
\end{aligned}$$

□

Problem 2.29.*

Let R be a DVR with quotient field K, ord *the order function on K.*

(a) *If* $\mathrm{ord}(a) < \mathrm{ord}(b)$*, show that* $\mathrm{ord}(a+b) = \mathrm{ord}(a)$.

(b) *If* $a_1, \ldots, a_n \in K$*, and for some* i, $\mathrm{ord}(a_i) < \mathrm{ord}(a_j)$ *(all* $j \neq i$*), then* $a_1 + \cdots + a_n \neq 0$.

Proof of (a).

(1) Let t be a uniformizing parameter for R. Given any $a, b \in K$. Write $a = ut^n, b = vt^m$ where u, v are units in R and n, m are integers.

(2) Since $\mathrm{ord}(a) < \mathrm{ord}(b)$, $n < m$. Hence,

$$a + b = (u + vt^{m-n})t^n.$$

To show that $\mathrm{ord}(a+b) = \mathrm{ord}(a) = n$, it suffices to show that $u + vt^{m-n}$ is a unit in R.

(3) (Reductio ad absurdum) Suppose that $u+vt^{m-n}$ were not a unit. Since R is local, the maximal ideal (t) contains all nonunit elements in R. Hence, $u + vt^{m-n} \in (t)$. As $m - n > 0$, $vt^{m-n} \in (t)$ and thus a unit $u \in (t)$, contrary to the maximality of (t).

□

Proof of (b).

(1) Might assume that $\mathrm{ord}(a_1) < \mathrm{ord}(a_j)$ (all $j \neq 1$). In particular, $\mathrm{ord}(a_1) < \infty$.

(2) Similar to (a). Let t be a uniformizing parameter for R. Write $a_i = u_i t^{m_i}$ where u_i are units in R and m_i are integers. ($i = 1, \ldots, n$.) Since $\mathrm{ord}(a_1) < \mathrm{ord}(a_j)$ (all $j \neq 1$), $m_1 < m_j$. Hence,

$$a_1 + \cdots + a_n = (u_1 + \underbrace{u_2 t^{m_2 - m_1} + \cdots + u_n t^{m_n - m_1}}_{\in (t)})t^{m_1}.$$

So $u_1 + u_2 t^{m_2 - m_1} + \cdots + u_n t^{m_n - m_1}$ is a unit in R.

(3) By (1)(2),

$$\mathrm{ord}(a_1 + \cdots + a_n) = \mathrm{ord}(a_1) < \infty,$$

or $a_1 + \cdots + a_n \neq 0$ (since ord is an order function on K).

□

Problem 2.30.*

Let R be a DVR with maximal ideal $\mathfrak{m}$, and quotient field K, and suppose a field k is a subring of R, and that the composition $k \to R \to R/\mathfrak{m}$ is an isomorphism of k with $R/\mathfrak{m}$ (as for example in Problem 2.24). Verify the following assertions:

(a) *For any $z \in R$, there is a unique $\lambda \in k$ such that $z - \lambda \in \mathfrak{m}$.*

(b) *Let t be a uniformizing parameter for R, $z \in R$. Then for any $n \geq 0$ there are unique $\lambda_0, \lambda_1, \ldots, \lambda_n \in k$ and $z_n \in R$ such that*

$$z = \lambda_0 + \lambda_1 t + \lambda_2 t^2 + \cdots + \lambda_n t^n + z_n t^{n+1}.$$

(Hint: For uniqueness use Problem 2.29; for existence use (a) and induction.)

Proof of (a).

(1) Note that

$$k \xrightarrow{i} R \xrightarrow{\pi} R/\mathfrak{m}$$

is an isomorphism.

(2) For $z + \mathfrak{m} \in R/\mathfrak{m}$, there exists the unique $\lambda \in k$ such that

$$z + \mathfrak{m} = \pi(i(\lambda)) = \pi(\lambda) = \lambda + \mathfrak{m}.$$

So $z - \lambda \in \mathfrak{m}$ for one unique $\lambda \in k$.

□

Proof of (b).

(1) Note that

$$\mathfrak{m} = \{z \in K : \mathrm{ord}(z) > 0\}.$$

By (a),

$$z = \lambda_0 + \underbrace{t z_0}_{\in \mathfrak{m}}$$

for one unique $\lambda_0 \in k$ and $z_0 \in R$. Continue this process or by induction, we have the expression

$$z = \lambda_0 + \lambda_1 t + \lambda_2 t^2 + \cdots + \lambda_n t^n + z_n t^{n+1}.$$

(2) For the uniqueness, suppose

$$0 = \lambda_0 + \lambda_1 t + \lambda_2 t^2 + \cdots + \lambda_n t^n + z_n t^{n+1}.$$

Note that

$$\mathrm{ord}(\lambda_i t^i) = \begin{cases} \infty & (\lambda_i = 0) \\ i & (\lambda_i \neq 0) \end{cases}$$

since every nonzero element in k is a unit in $k \subseteq R$. Also, $\mathrm{ord}(z_n t^{n+1}) = \infty$ if $z_n = 0$; $\mathrm{ord}(z_n t^{n+1}) \geq n + 1$ if $z_n \neq 0$.

(3) Suppose i_0 is the smallest integer such that $\lambda_{i_0} \neq 0$, then $\operatorname{ord}(\lambda_{i_0} t^{i_0}) = i_0 < \operatorname{ord}(\lambda_j t^j)$ if $i_0 \neq j$ and $\operatorname{ord}(\lambda_{i_0} t^{i_0}) = i_0 < n+1 \leq \operatorname{ord}(z_n t^{n+1})$. By Problem 2.29(b), such i_0 does not exist. Hence all $\lambda_i = 0$. So as R is a domain, z_n is also equal to 0. Therefore, the uniqueness is established.

□

Problem 2.31. (Formal power series)

Let k be a field. The ring of ***formal power series*** *over k, written $k[[x]]$, is defined to be*

$$\left\{ \sum_{i=0}^{\infty} a_i x^i : a_i \in k \right\}.$$

(As with polynomials, a rigorous definition is best given in terms of sequences $(a_0, a_1, \ldots)$ of elements in k; here we allow an infinite number of nonzero terms.) Define the sum by

$$\sum a_i x^i + \sum b_i x^i = \sum (a_i + b_i) x^i,$$

and the (Cauchy) product by

$$\left(\sum a_i x^i \right) \left(\sum b_i x^i \right) = \sum c_i x^i,$$

where $c_i = \sum_{j+k=i} a_j b_k$. Show that $k[[x]]$ is a ring containing $k[x]$ as a subring. Show that $k[[x]]$ is a DVR with uniformizing parameter x. Its quotient field is denoted $k((x))$.

Proof.

(1) Two formal power series $\sum a_i x^i$ and $\sum b_i x^i$ in $k[[x]]$ are considered equal if $a_i = b_i$ for all integers $i \geq 0$.

(2) The zero element in $k[[x]]$ is $0 = \sum_{i=0}^{\infty} 0x^i$, and the multiplicative identity is

$$1 = 1 + 0x + \cdots + 0x^n + \cdots.$$

Hence, $k[[x]]$ is a ring (by a tedious argument). Moreover, $k[[x]]$ is a domain (again by a tedious argument).

(3) *Show that $k[[x]] \supseteq k[x]$.* In fact, for any $f = \sum_{i=0}^{n} a_i x^i \in k[x]$, we can write

$$f = a_0 + a_1 x + \cdots + a_n x^n + 0x^{n+1} + \cdots \in k[[x]].$$

(4) *Show that* $f = \sum_{i=0}^{\infty} a_i x^i$ *is a unit in* $k[[x]]$ *if and only if* $a_0 \neq 0$. Suppose $g = \sum_{i=0}^{\infty} b_i x^i \in k[[x]]$ such that $fg = 1$. Then

$$\begin{aligned} 1 &= a_0 b_0, \\ 0 &= \sum_{j=0}^{k} a_j b_{k-j}. \end{aligned}$$

So f is not a unit in $k[[x]]$ if $a_0 = 0$. Now if $a_0 \neq 0$ then $b_0 := a_0^{-1} \in k$. Then by observing that

$$\begin{aligned} 0 = \sum_{j=0}^{k} a_j b_{k-j} &\iff a_0 b_k = -\sum_{j=1}^{k} a_j b_{k-j} \\ &\iff b_k = -b_0 \sum_{j=1}^{k} a_j b_{k-j}, \end{aligned}$$

we can solve $b_1, b_2, \ldots$ by induction, and $(b_0, b_1, \ldots)$ gives the existence of $g \in k[[x]]$.

(5) By (4), $k[[x]]$ is not a field since $x \in k[[x]]$ but $x^{-1} \notin k[[x]]$. Let $t = x$ be an irreducible element in $k[[x]]$. ($\deg(x) = 1$ implies the irreducibility of t.) Hence every nonzero $f \in k[[x]]$ can be written uniquely in the form

$$f = ux^n$$

where n is the smallest integer such that $a_n \neq 0$. By (4),

$$u = a_n + a_{n+1}x + \cdots$$

is a unit in $k[[x]]$ as $a_n \neq 0$. Besides, it is easy to show that n is unique by the similar argument in Problem 2.23. Therefore, $k[[x]]$ is a DVR with uniformizing parameter x.

□

Problem 2.32. (Power series expansion)

Let R be a DVR satisfying the conditions of Problem 2.30. Any $z \in R$ then determines a power series $\sum \lambda_i x^i$, if $\lambda_0, \lambda_1, \ldots$ are determined as in Problem 2.30(b).

(a) *Show that the map $z \to \sum \lambda_i x^i$ is a one-to-one ring homomorphism of R into $k[[x]]$. We often write $z = \sum \lambda_i t^i$, and call this the* ***power series expansion*** *of z in terms of t.*

(b) *Show that the homomorphism extends to a homomorphism of K into $k((x))$, and that the order function on $k((x))$ restricts to that on K.*

(c) *Let $a = 0$ in Problem 2.24, $t = x$. Find the power series expansion of $z = (1-x)^{-1}$ and of $(1-x)(1+x^2)^{-1}$ in terms of t.*

Proof of (a).

(1) Define the map $\alpha : R \to k[[x]]$ by

$$\alpha : z \mapsto \sum_{i=0}^{\infty} \lambda_i x^i$$

where λ_i are determined as in Problem 2.30(b).

(2) *Show that α is well-defined and one-to-one.* Write

$$\alpha(z) = \sum_{i=0}^{\infty} \lambda_i x^i = \sum_{i=0}^{\infty} \lambda_i' x^i.$$

If there were $\lambda_n \neq \lambda_n'$ for some n, then Problem 2.30(b) implies that two expressions of z

$$\begin{aligned} z &= \lambda_0 + \lambda_1 t + \cdots + \lambda_n t^n + z_n t^{n+1} \\ &= \lambda_0' + \lambda_1' t + \cdots + \lambda_n' t^n + z_n' t^{n+1} \end{aligned}$$

are the same. That is, $\lambda_n = \lambda_n'$, which is absurd. Hence, α is well-defined. Also, $0 = 0 + 0t + 0t^2 + \cdots + 0t^n + 0t^{n+1}$ implies that α is one-to-one.

(3) *Show that α is addition preserving.* Given $a, b \in R$. By Problem 2.30(b),

$$a + b = \lambda_0 + \lambda_1 t + \cdots + \lambda_n t^n + c_n t^{n+1}$$

and

$$\begin{aligned} a &= \mu_0 + \mu_1 t + \cdots + \mu_n t^n + a_n t^{n+1} \\ b &= \nu_0 + \nu_1 t + \cdots + \nu_n t^n + b_n t^{n+1} \end{aligned}$$

for any integer $n \geq 0$. So

$$a + b = \underbrace{(\mu_0 + \nu_0)}_{\in k} + \underbrace{(\mu_1 + \nu_1)}_{\in k} t + \cdots + \underbrace{(\mu_n + \nu_n)}_{\in k} t^n + \underbrace{(a_n + b_n)}_{\in R} t^{n+1}.$$

Since the expression of $a + b$ is unique (by Problem 2.30(b)),

$$\lambda_i = \mu_i + \nu_i$$

for all $i = 0, 1, \ldots, n$. Since n is arbitrary, $\lambda_i = \mu_i + \nu_i$ is true for all nonnegative integers. Hence, $\alpha(a + b) = \alpha(a) + \alpha(b)$.

(4) *Show that α is multiplication preserving.* Given $a, b \in R$. By Problem 2.30(b),

$$ab = \lambda_0 + \lambda_1 t + \cdots + \lambda_n t^n + c_n t^{n+1}$$

and

$$a = \mu_0 + \mu_1 t + \cdots + \mu_n t^n + a_n t^{n+1}$$
$$b = \nu_0 + \nu_1 t + \cdots + \nu_n t^n + b_n t^{n+1}$$

for any integer $n \geq 0$. So

$$\begin{aligned} ab = &\underbrace{(\mu_0\nu_0)}_{\in k} + \underbrace{(\mu_1\nu_0 + \mu_0\nu_1)}_{\in k} t + \cdots \\ &+ \underbrace{(\mu_n\nu_0 + \mu_{n-1}\nu_1 + \cdots + \mu_1\nu_{n-1} + \mu_0\nu_n)}_{\in k} t^n \\ &+ \underbrace{(\text{other terms})}_{\in R} t^{n+1}. \end{aligned}$$

Since the expression of $a + b$ is unique (by Problem 2.30(b)),

$$\lambda_i = \sum_{j+k=i} \mu_j \nu_k$$

for all $i = 0, 1, \ldots, n$. Since n is arbitrary, $\lambda_i = \sum_{j+k=i} \mu_j + \nu_k$ is true for all nonnegative integers. Hence, $\alpha(ab) = \alpha(a)\alpha(b)$.

(5) *Show that α is multiplicative identity preserving.* Note that

$$1 = \underbrace{1}_{\in k} + \underbrace{0}_{\in k} t + \cdots + \underbrace{0}_{\in k} t^n + \underbrace{0}_{\in k} t^{n+1}$$

for every nonnegative integer n. Hence $\alpha : 1 \mapsto 1 \in k[[x]]$.

(6) By (3)(4)(5), α is a ring homomorphism.

□

Proof of (b).

(1) Define the mapping β from K to $k((x))$ by

$$\beta : a/b \mapsto \alpha(a)/\alpha(b)$$

where $a, b \in R$ and $b \neq 0$.

(2) β is well-defined since:

(a) $\alpha(b) \neq 0$ if $b \neq 0$ by the injectivity of α.

(b) The value of $\beta(a/b)$ is independent of the choice of $a/b \in K$ since α is a ring homomorphism.

(3) Also, β is a ring homomorphism since α is a ring homomorphism.

(4) To show that the order function on $k((x))$ restricts to that on K, it suffices to show that

$$\mathrm{ord}_R(z) = \mathrm{ord}_{k[[x]]}(\alpha(z)).$$

In fact,

$$\begin{aligned} m := \mathrm{ord}_R(z) &\iff z = \lambda_m t^m + \cdots + \lambda_n t^n + z_n t^{n+1} \text{ with } \lambda_m \neq 0 \\ &\iff \alpha(z) = \lambda_m x^m + \cdots \text{ with } \lambda_m \neq 0 \\ &\iff \mathrm{ord}_{k[[x]]}(\alpha(z)) = m. \end{aligned}$$

□

Proof of (c).

(1) In calculus we have

$$(1-x)^{-1} = 1 + x + x^2 + \cdots = \sum_{i=0}^{\infty} x^i$$

for $|x| < 1$. In the ring of formal power series $k[[x]]$, $1 - x$ is a unit (by (4) in the proof of Problem 2.31) and satisfies

$$(1-x)\left(\sum_{i=0}^{\infty} x^i\right) = 1 \in k[[x]].$$

Hence, the power expansion of $(1-x)^{-1}$ is

$$(1-x)^{-1} = \sum_{i=0}^{\infty} x^i \in k((x)).$$

(2) Note that $1 + x^2$ is a unit in $k[[x]]$ and satisfies

$$(1+x^2)\left(\sum_{i=0}^{\infty} (-1)^i x^{2i}\right) = 1 \in k[[x]].$$

Hence, the power expansion of $(1-x)(1+x^2)^{-1}$ is

$$\begin{aligned} (1-x)\left(\sum_{i=0}^{\infty} (-1)^i x^{2i}\right) &= \left(\sum_{i=0}^{\infty} (-1)^i x^{2i}\right) - x\left(\sum_{i=0}^{\infty} (-1)^i x^{2i}\right) \\ &= \sum_{i=0}^{\infty} (-1)^i x^{2i} + \sum_{i=0}^{\infty} (-1)^{i+1} x^{2i+1} \\ &= \sum_{i=0}^{\infty} (-1)^i x^i \in k[[x]]. \end{aligned}$$

□

2.6. Forms

Problem 2.33.

Factor $y^3 - 2xy^2 + 2x^2y + x^3$ into linear factors in $\mathbb{C}[x, y]$.

Proof.

(1) Let $f(x, y) = y^3 - 2xy^2 + 2x^2y + x^3$. Then $f_*(x) = 1 - 2x + 2x^3 + x^3$.

(2) Solve $f_*(x) = 0$ over $\mathbb{C}$ by WolframAlpha (a computational knowledge engine) to get

$$\alpha_1 = -\frac{2}{3} - \frac{10}{3}\sqrt[3]{\frac{2}{79 - 3\sqrt{249}}} - \frac{1}{3}\sqrt[3]{\frac{79 - 3\sqrt{249}}{2}}$$

$$\alpha_2 = -\frac{2}{3} + \frac{5}{3}(1 - \sqrt{3}i)\sqrt[3]{\frac{2}{79 - 3\sqrt{249}}} + \frac{1}{6}(1 + \sqrt{3}i)\sqrt[3]{\frac{79 - 3\sqrt{249}}{2}}$$

$$\alpha_3 = -\frac{2}{3} + \frac{5}{3}(1 + \sqrt{3}i)\sqrt[3]{\frac{2}{79 - 3\sqrt{249}}} + \frac{1}{6}(1 - \sqrt{3}i)\sqrt[3]{\frac{79 - 3\sqrt{249}}{2}}.$$

So $f_*(x) = (x - \alpha_1)(x - \alpha_2)(x - \alpha_3)$.

(3) Hence,

$$\begin{aligned} f(x, y) &= (f_*)^* \\ &= ((x - \alpha_1)(x - \alpha_2)(x - \alpha_3))^* \\ &= (x - \alpha_1 y)(x - \alpha_2 y)(x - \alpha_3 y). \end{aligned}$$

□

Note. If $f(x, y) = y^3 - 2xy^2 + 2x^2y + 4x^3$, then

$$f(x, y) = (x - \alpha_1 y)(x - \alpha_2 y)(x - \alpha_3 y)$$

where

$$\alpha_1 = -\frac{1}{6} - \frac{7}{6}\sqrt[3]{\frac{1}{37-3\sqrt{114}}} - \frac{1}{6}\sqrt[3]{37-3\sqrt{114}}$$

$$\alpha_2 = -\frac{1}{6} + \frac{7}{12}(1-\sqrt{3}i)\sqrt[3]{\frac{1}{37-3\sqrt{114}}} + \frac{1}{12}(1+\sqrt{3}i)\sqrt[3]{37-3\sqrt{114}}$$

$$\alpha_3 = -\frac{1}{6} + \frac{7}{12}(1+\sqrt{3}i)\sqrt[3]{\frac{1}{37-3\sqrt{114}}} + \frac{1}{12}(1-\sqrt{3}i)\sqrt[3]{37-3\sqrt{114}}.$$

Problem 2.34.

Suppose $f, g \in k[x_1, \ldots, x_n]$ are forms of degree r, $r+1$ respectively, with no common factors (k a field). Show that $f+g$ is irreducible.

Proof.

(1) Suppose $f + g = rs \in k[x_1, \ldots, x_n]$. Proposition 5 implies that

$$(f+g)^* = (rs)^* \Longrightarrow x_{n+1}f + g = r^*s^*.$$

Note that $\deg_{x_{n+1}}(x_{n+1}f+g) = 1$. So $\deg_{x_{n+1}}(r^*) = 0$ or $\deg_{x_{n+1}}(s^*) = 0$. Might assume $\deg_{x_{n+1}}(r^*) = 0$. (The case $\deg_{x_{n+1}}(s^*) = 0$ is similar.)

(2) Since $\deg_{x_{n+1}}(r^*) = 0$, $r^* \mid f$ and $r^* \mid g$. Note that $\deg_{x_{n+1}}(r^*) = 0$ implies that $r^* = r$ is a form in $k[x_1, \ldots, x_n]$. Hence r is a common factor of f and g, or r is a constant in $k[x_1, \ldots, x_n]$. So $f+g$ is irreducible.

□

Problem 2.35.*

(a) *Show that there are $d+1$ monomials of degree d in $R[x, y]$, and $1 + 2 + \cdots + (d+1) = \frac{(d+1)(d+2)}{2}$ monomials of degree d in $R[x, y, z]$.*

(b) *Let $V(d, n) = \{$forms of degree d in $k[x_1, \ldots, x_n]\}$, k a field. Show that $V(d, n)$ is a vector space over k, and that the monomials of degree d form a basis. So $\dim V(d, 1) = 1$; $\dim V(d, 2) = d+1$; $\dim V(d, 3) = \frac{(d+1)(d+2)}{2}$.*

(c) *Let $\ell_1, \ell_2, \ldots$ and $m_1, m_2, \ldots$ be sequences of nonzero linear forms in $k[x, y]$, and assume no $\ell_i = \lambda m_j$, $\lambda \in k$. Let $A_{ij} = \ell_1\ell_2\cdots\ell_i m_1 m_2 \cdots m_j$, $i, j \geq 0$ ($A_{00} = 1$). Show that $\{A_{ij} : i + j = d\}$ forms a basis for $V(d, 2)$.*

Proof of (a).

(1) All monomials of degree d in $R[x, y]$ are

$$x^d, x^{d-1}y, \cdots, xy^{d-1}, y^d,$$

or of the form $x^i y^j$ with $i, j \geq 0$ and $i+j = d$. So there are $d+1$ monomials of degree d in $R[x, y]$.

(2) Similar to (1), all monomials of degree d in $R[x, y]$ are of the form $x^i y^j z^k$ with $i, j, k \geq 0$ and $i + j + k = d$. By the stars and bars (combinatorics) method, there are

$$\binom{d+3-1}{3-1} = \frac{(d+2)(d+1)}{2}$$

monomials of degree d in $R[x, y, z]$.

□

Proof of (b).

(1) To show $V(d, n)$ is a vector space, it suffices to show that $V(d, n)$ is a subspace of $k[x_1, \ldots, x_n]$ since $k[x_1, \ldots, x_n]$ is a vector space over k.

(2) Note that $0 \in V(d, n)$ is nonempty. For any $f, g \in V(d, n)$ and $a, b \in k$, we have $af + bg \in V(d, n)$. Hence $V(d, n)$ is subspace.

(3) Let

$$\mathscr{B} = \{x_1^{i_1} \cdots x_n^{i_n} : i_1, \ldots, i_n \geq 0, i_1 + \cdots + i_n = d\}.$$

$\mathscr{B}$ is an independent set, and $\mathscr{B}$ generates $V(d, n)$. So $\mathscr{B}$ is a basis for $V(d, n)$.

(4) Similar to (a),

$$\dim_k V(d, n) = |\mathscr{B}| = \binom{d+n-1}{n-1}$$

by the stars and bars (combinatorics) method. In particular, $\dim V(d, 1) = 1$; $\dim V(d, 2) = d + 1$; $\dim V(d, 3) = \frac{(d+1)(d+2)}{2}$.

□

Proof of (c).

(1) *Show that $\mathscr{B}' := \{A_{ij} : i + j = d\}$ is an independent set.* (Reductio ad absurdum) Suppose that there were a nontrivial linear combination of A_{ij} such that

$$\sum_{i+j=d} c_{ij} A_{ij} = 0.$$

(2) Let p be the smallest index i such that $c_{ij} \neq 0$. Write $q := d - p$. So

$$\begin{aligned}
& c_{pq}A_{pq} = -\sum_{\substack{i+j=d \\ i\neq p, j\neq q}} c_{ij}A_{ij} = -\sum_{\substack{i+j=d \\ i>p, j<q}} c_{ij}A_{ij} \\
\iff & A_{pq} = -\sum_{\substack{i+j=d \\ i>p, j<q}} \frac{c_{ij}}{c_{pq}} A_{ij} \\
\iff & \ell_1 \cdots \ell_p m_1 \cdots m_q = -\sum_{\substack{i+j=d \\ i>p, j<q}} \frac{c_{ij}}{c_{pq}} \ell_1 \cdots \ell_p \ell_{p+1} \cdots \ell_i m_1 \cdots m_j \\
\iff & m_1 \cdots m_q = -\ell_{p+1} \sum_{\substack{i+j=d \\ i>p, j<q}} \frac{c_{ij}}{c_{pq}} \underbrace{\ell_{p+2} \cdots \ell_i}_{:=1 \text{ if } i=p+1} m_1 \cdots m_j \\
\iff & \ell_{p+1} \mid m_1 \cdots m_q.
\end{aligned}$$

Since all ℓ_i, m_j are linear forms, $\ell_{p+1} \mid m_j$ for some $1 \leq j \leq q$, which is absurd since no $\ell_i = \lambda m_j$, $\lambda \in k$. Therefore, $\mathscr{B}'$ is an independent set.

(3) Since

$$|\mathscr{B}'| = d + 1 = \dim_k V(d, 2),$$

$\mathscr{B}'$ is also a basis for $V(d, 2)$.

□

Problem 2.36.

With the above notation, show that

$$\dim V(d, n) = \binom{d+n-1}{n-1},$$

the binomial coefficient.

Proof. See the proof of Problem 2.35(b). □

2.7. Direct Products of Rings

Problem 2.37.

What are the additive and multiplicative identities in $\bigtimes R_i$? Is the map from R_i to $\bigtimes R_i$ taking a_i to $(0, \ldots, a_i, \ldots, 0)$ a ring homomorphism?

Proof.

(1) $(0, \ldots, 0)$ is the additive identity in $\bigtimes R_i$.

(2) $(1, \ldots, 1)$ is the multiplicative identity in $\bigtimes R_i$.

(3) The map $\alpha : R_i \to \bigtimes R_i$ taking a_i to $(0, \ldots, a_i, \ldots, 0)$ is not a ring homomorphism since

$$\alpha(1) = (0, \ldots, 1, \ldots, 0) \neq (1, \ldots, 1),$$

or α is not multiplicative identity preserving (if R_j is not the zero ring for some $j \neq i$).

□

Problem 2.38.*

Show that if $k \subseteq R_i$, and each R_i is finite-dimensional over k, then $\dim\left(\bigtimes R_i\right) = \sum \dim(R_i)$.

Proof.

(1) In the terminology of linear algebra, $\bigtimes R_i$ is the direct sum $\bigoplus R_i$ of R_i.

(2) Hence,

$$\dim_k\left(\bigoplus R_i\right) = \sum \dim_k(R_i).$$

□

2.8. Operations with Ideals

Problem 2.39.*

Prove the following relations among ideals I_i, J in a ring R:

(a) $(I_1 + I_2)J = I_1J + I_2J$.

(b) $(I_1 \cdots I_N)^n = I_1^n \cdots I_N^n$.

Proof of (a).

(1) Note that $(I_1 + I_2)J$ and $I_1J + I_2J$ are ideals.

(2) *Show that* $(I_1 + I_2)J \subseteq I_1J + I_2J$. Given any

$$(x_1 + x_2)y \in (I_1 + I_2)J$$

where $x_i \in I_i$ and $y \in J$. It suffices to show that $(x_1 + x_2)y \in I_1J + I_2J$ (by (1)). In fact,

$$(x_1 + x_2)y = x_1y + x_2y \in I_1J + I_2J.$$

(3) *Show that* $(I_1 + I_2)J \supseteq I_1J + I_2J$. Given any

$$x_1y_1 + x_2y_2 \in I_1J + I_2J$$

where $x_i \in I_i$ and $y_i \in J$. It suffices to show that $x_1y_1 + x_2y_2 \in (I_1 + I_2)J$ (by (1)). In fact,

$$x_1y_1 + x_2y_2 = (x_1 + \underbrace{0}_{\in I_2})y_1 + (\underbrace{0}_{\in I_1} + x_2)y_2 \in (I_1 + I_2)J$$

since $(I_1 + I_2)J$ is an ideal.

□

Proof of (b).

(1) Note that $(I_1 \cdots I_N)^n$ and $I_1^n \cdots I_N^n$ are ideals.

(2) *Show that* $(I_1 \cdots I_N)^n \subseteq I_1^n \cdots I_N^n$. Given any

$$x = x_1 \cdots x_n$$

where $x_i \in I_1 \cdots I_N$. It suffices to show that $x \in I_1^n \cdots I_N^n$ (by (1)). For each $x_i \in I_1 \cdots I_N$, write

$$x_i = \sum_{j(i)} x_{j(i),1} \cdots x_{j(i),N}$$

where $x_{j(i),k} \in I_k$ for $1 \leq k \leq N$. Hence

$$\begin{aligned}
x &= x_1 \cdots x_n \\
&= \left(\sum_{j(1)} x_{j(1),1} \cdots x_{j(1),N} \right) \cdots \left(\sum_{j(n)} x_{j(n),1} \cdots x_{j(n),N} \right) \\
&= \sum_{j(1),\ldots,j(n)} (x_{j(1),1} \cdots x_{j(1),N}) \cdots (x_{j(n),1} \cdots x_{j(n),N}) \\
&= \sum_{j(1),\ldots,j(n)} \underbrace{(x_{j(1),1} \cdots x_{j(n),1})}_{\in I_1^n} \cdots \underbrace{(x_{j(1),N} \cdots x_{j(n),N})}_{\in I_N^n} \\
&\in I_1^n \cdots I_N^n.
\end{aligned}$$

(3) *Show that* $(I_1 \cdots I_N)^n \supseteq I_1^n \cdots I_N^n$. Given any

$$x = x_1 \cdots x_N \in I_1^n \cdots I_N^n$$

where $x_i \in I_i^n$ $(1 \leq i \leq N)$. It suffices to show that $x \in (I_1 \cdots I_N)^n$ (by (1)). For each $x_i \in I_i^n$, write

$$x_i = \sum_{j(i)} x_{j(i),1} \cdots x_{j(i),n}$$

where $x_{j(i),k} \in I_i$ for $1 \leq k \leq n$. Hence

$$\begin{aligned} x &= x_1 \cdots x_N \\ &= \left(\sum_{j(1)} x_{j(1),1} \cdots x_{j(1),n} \right) \cdots \left(\sum_{j(N)} x_{j(N),1} \cdots x_{j(N),n} \right) \\ &= \sum_{j(1),\ldots,j(N)} (x_{j(1),1} \cdots x_{j(1),n}) \cdots (x_{j(N),1} \cdots x_{j(N),n}) \\ &= \sum_{j(1),\ldots,j(N)} \underbrace{(x_{j(1),1} \cdots x_{j(N),1})}_{\in I_1 \cdots I_N} \cdots \underbrace{(x_{j(1),n} \cdots x_{j(N),n})}_{\in I_1 \cdots I_N} \\ &\in (I_1 \cdots I_N)^n. \end{aligned}$$

□

Problem 2.40.* (Chinese remainder theorem)

(a) *Suppose* I, J *are comaximal ideals in* R. *Show that* $I + J^2 = R$. *Show that* I^m *and* J^n *are comaximal for all* m, n.

(b) *Suppose* $I_1, \ldots, I_N$ *are ideals in* R, *and* I_i *and* $J_i = \cap_{j \neq i} I_j$ *are comaximal for all* i. *Show that*

$$I_1^n \cap \cdots \cap I_N^n = (I_1 \cdots I_N)^n = (I_1 \cap \cdots \cap I_N)^n$$

for all n.

Proof of (a).

(1) It suffices to show that $I^m + J^n = R$.

(2) Since $I^m + J^n \subseteq R$ is always true, it suffices to show that $I^m + J^n \supseteq R$. In fact,

$$\begin{aligned} R &= R^{m+n-1} && (1 \in R) \\ &= (I+J)^{m+n-1} && (I, J \text{ are comaximal}) \\ &= \sum_{i=0}^{m+n-1} I^i J^{m+n-1-i} && (\text{Problem } 2.39) \\ &\subseteq I^m + J^n \end{aligned}$$

for all positive integers m, n. (If $m = 0$ or $n = 0$, then nothing to prove.)

□

Proof of (b).

(1) *Show that I_i and I_j are comaximal if $i \neq j$.* Note that

$$R = I_i + J_i \subseteq I_i + I_j \subseteq R$$

if $i \neq j$.

(2) *If I_i is comaximal to I_j and $I_{j'}$. Show that I_i is also comaximal to $I_j I_{j'}$.*

$$\begin{aligned} R &= (I_i + I_j)(I_i + I_{j'}) \\ &= I_i(I_i + I_j + I_{j'}) + I_j I_{j'} && (\text{Problem } 2.39(\text{a})) \\ &\subseteq I_i + I_j I_{j'} \subseteq R. \end{aligned}$$

(3) By (2), it is easy to get that I_i and $\prod_{j \neq i} I_j$ are comaximal by induction on the number of I_j for $j \neq i$.

(4) *Show that $I_1 \cdots I_N = I_1 \cap \cdots \cap I_N$.* Induction on N.

$$\begin{aligned} I_1 \cap \cdots \cap I_N &= I_1 \cap (I_2 \cap \cdots \cap I_N) \\ &= I_1 \cap (I_2 \cdots I_N) && (\text{Induction hypothesis}) \\ &= I_1 \cdot (I_2 \cdots I_N) && ((3)) \\ &= I_1 \cdots I_N. \end{aligned}$$

(5) Note that I_i^n and I_j^n are comaximal if $i \neq j$ by (a). We can apply the same argument in (2)(3)(4) to show that

$$I_1^n \cdots I_N^n = I_1^n \cap \cdots \cap I_N^n.$$

(6) Therefore,

$$\begin{aligned} (I_1 \cap \cdots \cap I_N)^n &= (I_1 \cdots I_N)^n && ((4)) \\ &= I_1^n \cdots I_N^n && (\text{Problem } 2.39(\text{b})) \\ &= I_1^n \cap \cdots \cap I_N^n && ((5)). \end{aligned}$$

□

Problem 2.41.*

Let I, J be ideals in R. Suppose I is finitely generated and $I \subseteq \operatorname{rad}(J)$. Show that $I^n \subseteq J$ for some n.

Proof.

(1) Let I be generated by $x_1, \ldots, x_m \in I$. As $I \subseteq \operatorname{rad}(J)$, there are integers $n_i > 0$ such that $x_i^{n_i} \in J$.

(2) Let $N = n_1 + \cdots + n_m$. Given any $x = \sum_{i=1}^m r_i x_i \in I$, so

$$\begin{aligned} x^N &= \left(\sum_{i=1}^m r_i x_i \right)^N \\ &= \sum_{k_1 + \cdots + k_m = N} \binom{N}{k_1, \ldots, k_m} r_1^{k_1} x_1^{k_1} \cdots r_m^{k_m} x_m^{k_m}. \end{aligned}$$

(3) Note that for each term there is some j such that $k_j \geq n_j$. Hence,

$$\begin{aligned} & x_j^{k_j} = x_j^{k_j - n_j} x_j^{n_j} \in J && (J \text{ is an ideal}) \\ \implies & r_1^{k_1} x_1^{k_1} \cdots r_m^{k_m} x_m^{k_m} \in J \text{ for each term} && (J \text{ is an ideal}) \\ \implies & x^N \in J. && (J \text{ is an ideal}) \\ \implies & I^N \subseteq J. \end{aligned}$$

□

Supplement. *(Exercise 1.13 in the textbook: Eisenbud, Commutative Algebra with a View Toward Algebraic Geometry.) Suppose that I is an ideal in a commutative ring. Show that if $\operatorname{rad}(I)$ is finitely generated, then for some integer N we have $(\operatorname{rad}(I))^N \subseteq I$. Conclude that in a Noetherian ring the ideals I and J have the same radical iff there is some integer N such that $I^N \subseteq J$ and $J^N \subseteq I$. Use the Nullstellensatz to deduce that if $I, J \subseteq S = k[x_1, \ldots, x_n]$ are ideals and k is algebraically closed, then $Z(I) = Z(J)$ iff $I^N \subseteq J$ and $J^N \subseteq I$ for some N.*

Proof.

(1) *Show that if* $\operatorname{rad}(I)$ *is finitely generated, then for some integer N we have* $(\operatorname{rad}(I))^N \subseteq I$. Say $x_1, \ldots, x_m \in \operatorname{rad}(I)$ generate $\operatorname{rad}(I)$.

   (a) For each i, there exists an integer $n_i > 0$ such that $x_i^{n_i} \in I$ (since $\operatorname{rad}(I)$ is radical).

(b) Let $N = n_1 + \cdots + n_m$. Given any $x = \sum_{i=1}^m r_i x_i \in \mathrm{rad}(I)$, so

$$\begin{aligned} x^N &= \left(\sum_{i=1}^m r_i x_i \right)^N \\ &= \sum_{k_1+\cdots+k_m=N} \binom{N}{k_1, \ldots, k_m} r_1^{k_1} x_1^{k_1} \cdots r_m^{k_m} x_m^{k_m}. \end{aligned}$$

(c) Note that for each term there is some j such that $k_j \geq n_j$. Hence,

$$\begin{aligned} & x_j^{k_j} = x_j^{k_j - n_j} x_j^{n_j} \in I && (I \text{ is an ideal}) \\ \Longrightarrow\ & r_1^{k_1} x_1^{k_1} \cdots r_m^{k_m} x_m^{k_m} \in I \text{ for each term} && (I \text{ is an ideal}) \\ \Longrightarrow\ & x^N \in I. && (I \text{ is an ideal}) \\ \Longrightarrow\ & (\mathrm{rad}(I))^N \subseteq I. \end{aligned}$$

(2) *Show that in a Noetherian ring the ideals I and J have the same radical iff there is some integer N such that $I^N \subseteq J$ and $J^N \subseteq I$.*

(a) ($\Longrightarrow$) Since in a Noetherian ring every ideal is finitely generated, $\mathrm{rad}(I)$ and $\mathrm{rad}(J)$ are finitely generated. By (1), there is a common integer N such that

$$(\mathrm{rad}(I))^N \subseteq I \quad \text{and} \quad (\mathrm{rad}(J))^N \subseteq J.$$

Note that $I^N \subseteq (\mathrm{rad}(I))^N$ and $J^N \subseteq (\mathrm{rad}(J))^N$. Since $\mathrm{rad}(I) = \mathrm{rad}(J)$ by assumption,

$$\begin{aligned} I^N \subseteq (\mathrm{rad}(I))^N = (\mathrm{rad}(J))^N \subseteq J, \\ J^N \subseteq (\mathrm{rad}(J))^N = (\mathrm{rad}(I))^N \subseteq I. \end{aligned}$$

(b) ($\Longleftarrow$) It suffices to show that $\mathrm{rad}(I) \subseteq \mathrm{rad}(J)$. $\mathrm{rad}(J) \subseteq \mathrm{rad}(I)$ is similar. Given any $x \in \mathrm{rad}(I)$, there is an integer $M > 0$ such that $x^M \in I$. Hence $x^{MN} \in I^N \subseteq J$, or $x \in \mathrm{rad}(J)$.

(3) *Show that if $I, J \subseteq S = k[x_1, \ldots, x_n]$ are ideals and k is algebraically closed, then $Z(I) = Z(J)$ iff $I^N \subseteq J$ and $J^N \subseteq I$ for some N.* Note that S is Noetherian and we can apply part (2). By the Nullstellensatz, $Z(I) = Z(J)$ iff $\mathrm{rad}(I) = \mathrm{rad}(J)$ iff $I^N \subseteq J$ and $J^N \subseteq I$ for some N.

□

Problem 2.42.* (Isomorphism theorems for rings)

(a) *Let $I \subseteq J$ be ideals in a ring R. Show that there is a natural ring homomorphism from R/I onto R/J.*

(b) *Let I be an ideal in a ring R, R a subring of a ring S. Show that there is a natural ring homomorphism from R/I to S/IS.*

Proof of (a).

(1) Define a map $\alpha : R/I \to R/J$ by $\alpha(r+I) = r+J$.

(2) *Show that α is well-defined.* If $a+I = b+I$, then $a-b \in I \subseteq J$ or $a+J = b+J$. Hence, $\alpha(a+I) = a+J = b+J = \alpha(b+I)$.

(3) *Show that α is a surjective homomorphism.*

(a) *α is addition preserving.*

$$\begin{aligned}\alpha((a+I)+(b+I)) &= \alpha(a+b+I)\\ &= a+b+J\\ &= (a+J)+(b+J)\\ &= \alpha(a+I)+\alpha(b+I).\end{aligned}$$

(b) *α is multiplication preserving.*

$$\begin{aligned}\alpha((a+I)(b+I)) &= \alpha(ab+I)\\ &= ab+J\\ &= (a+J)(b+J)\\ &= \alpha(a+I)\alpha(b+I).\end{aligned}$$

(c) *α is multiplicative identity preserving.* $\alpha(1+I) = 1+J$.

(d) α is surjective since for any $a+J \in R/J$ there is an element $a+I \in R/I$ such that $\alpha(a+I) = a+J$.

(4) Note that $\ker(\alpha) = J/I$. So $(R/I)/(J/I) \cong R/J$.

□

Proof of (b).

(1) I is not necessary an ideal of S; IS an ideal of S (and thus S/IS is well-defined).

(2) Define a map $\alpha : R/I \to S/IS$ by $\alpha(r+I) = r+IS$. Note that $I \subseteq IS$ as a subset in S. Apply the same argument in (a), α is well-defined and α is a surjective homomorphism.

(3) Note that $\ker(\alpha) = (R \cap SI)/I$. So $(R/I)/((R \cap SI)/I) \cong S/IS$.

□

Problem 2.45.*

Show that ideals $I, J \subseteq k[x_1, \ldots, x_n]$ (k algebraically closed) are comaximal if and only if $V(I) \cap V(J) = \varnothing$.

Proof.

(1) *Show that $V(I) \cap V(J) = V(I + J)$.*

$$\begin{aligned} P \in V(I) \cap V(J) &\iff f(P) = 0 \,\forall f \in I \text{ and } g(P) = 0 \,\forall g \in J \\ &\iff f(P) = 0 \,\forall f \in I + J \\ &\iff P \in V(I + J). \end{aligned}$$

(2) Hence,

$$\begin{aligned} \varnothing = V(I) \cap V(J) &\iff \varnothing = V(I + J) && ((1)) \\ &\iff I + J = k[x_1, \ldots, x_n] && \text{(Weak Nullstellensatz)} \\ &\iff I \text{ and } J \text{ are comaximal.} \end{aligned}$$

□

Problem 2.46.*

Let $I = (x, y) \subseteq k[x, y]$. Show that

$$\dim_k(k[x, y]/I^n) = 1 + 2 + \cdots + n = \frac{n(n + 1)}{2}.$$

Proof.

(1) The set

$$\mathscr{B} = \{x^i y^j + I^n : i, j \in \mathbb{Z}, i, j \geq 0, i + j < n\}$$

generates $k[x, y]/I^n$ as a k-vector space. Besides, each nonzero element in I^n has the degree $\geq n$, and thus $\mathscr{B}$ is an independent set. Therefore, $\mathscr{B}$ is a basis for $k[x, y]/I^n$.

(2) Hence,

$$\dim_k(k[x, y]/I^n) = |\mathscr{B}| = 1 + 2 + \cdots + n = \frac{n(n + 1)}{2}.$$

□

2.9. Ideals with a Finite Number of Zeros

Problem 2.47.

Suppose R is a ring containing k, and R is finite dimensional over k. Show that R is isomorphic to a direct product of local rings.

Proof.

(1) Let $\{v_1, \ldots, v_n\}$ be a basis for R over k (as a vector space). Define a k-module homomorphism $\alpha : k[x_1, \ldots, x_n] \to R$ by $\alpha(x_i) = v_i$. Clearly, α is surjective and thus

$$R \cong k[x_1, \ldots, x_n]/\ker(\alpha)$$

as a k-module isomorphism. Note that $\ker(\alpha)$ is an ideal of $k[x_1, \ldots, x_n]$.

(2) Write $I := \ker(\alpha)$. Hence,

$$\dim_k(k[x_1, \ldots, x_n]/I) = \dim_k(R) < \infty.$$

By Corollary 4 to the Hilbert's Nullstellensatz in §1.7, $V(I)$ is finite.

(3) Write $V(I) = \{P_1, \ldots, P_N\}$ and $\mathcal{O}_i = \mathcal{O}_{P_i}(\mathbf{A}^n)$. By Proposition 6,

$$R \cong k[x_1, \ldots, x_n]/I \cong \prod_{i=1}^{N} \mathcal{O}_i/I\mathcal{O}_i,$$

which is isomorphic to a direct product of local rings.

□

2.10. Quotient Modules and Exact Sequences

Problem 2.48.*

Verify that for any R-module homomorphism $\varphi : M \to M'$, $\ker(\varphi)$ and $\mathrm{im}(\varphi)$ are submodules of M and M' respectively. Show that

$$0 \to \ker(\varphi) \to M \xrightarrow{\varphi} \mathrm{im}(\varphi) \to 0$$

is exact.

Proof.

(1) *Show that* $\ker(\varphi)$ *is a subgroup of* M. It suffices to show that $a-b \in \ker(\varphi)$ for all $a, b \in \ker(\varphi)$. In fact, $\varphi(a-b) = \varphi(a) - \varphi(b) = 0 - 0 = 0$, or $a - b \in \ker(\varphi)$.

(2) *Show that* $\ker(\varphi)$ *is a submodule of* M. By (1), it suffices to show that $ra \in \ker(\varphi)$ for all $r \in R$ and $a \in \ker(\varphi)$. In fact, $\varphi(ra) = r \cdot \varphi(a) = r \cdot 0 = 0$, or $ra \in \ker(\varphi)$.

(3) *Show that* $\mathrm{im}(\varphi)$ *is a subgroup of* M'. It suffices to show that $a-b \in \mathrm{im}(\varphi)$ for all $a, b \in \mathrm{im}(\varphi)$. As $a, b \in \mathrm{im}(\varphi)$, there are two elements $a', b' \in M$ such that $\varphi(a') = a$ and $\varphi(b') = b$. So $\varphi(a' - b') = \varphi(a') - \varphi(b') = a - b$, or $a - b \in \mathrm{im}(\varphi)$.

(4) *Show that* $\mathrm{im}(\varphi)$ *is a submodule of* M. By (3), it suffices to show that $ra \in \mathrm{im}(\varphi)$ for all $r \in R$ and $a \in \mathrm{im}(\varphi)$. As $a \in \mathrm{im}(\varphi)$, there is one element $a' \in M$ such that $\varphi(a') = a$. So $\varphi(ra') = r\varphi(a') = ra$, or $ra \in \mathrm{im}(\varphi)$.

(5) *Show that*

$$0 \to \ker(\varphi) \xrightarrow{i} M \xrightarrow{\varphi} \mathrm{im}(\varphi) \to 0$$

is exact. Note that $\ker(\varphi) \xrightarrow{i} M$ is the natural inclusion and $M \xrightarrow{\varphi} \mathrm{im}(\varphi)$ is surjective. Also, it is trivial that $\mathrm{im}(i) = \ker(\varphi)$.

□

Problem 2.51.

Let

$$0 \longrightarrow V_1 \longrightarrow \cdots \longrightarrow V_n \longrightarrow 0$$

be an exact sequence of finite-dimensional vector spaces. Show that $\sum(-1)^i \dim(V_i) = 0$.

Proof (Proposition 7 in §2.10).

(1) For $i = 0, \ldots, n$, by the rank-nullity theorem for a linear transformation $\varphi_i : V_i \to V_{i+1}$, we have

$$\dim V_i = \dim \mathrm{im}(\varphi_i) + \dim \ker(\varphi_i).$$

(Here $V_0 = V_{n+1} := 0$ by convention.)

(2) By the exactness of the sequence, we have

(a) $\mathrm{im}(\varphi_i) = \ker(\varphi_{i+1})$ for $i = 0, \ldots, n-1$. In particular, $\ker(\varphi_1) = \mathrm{im}(\varphi_0) = 0$.

(b) $\ker(\varphi_n) = V_n$.

Hence,

$$\begin{aligned}\sum_{i=1}^{n-1}(-1)^i \dim(V_i) &= \sum_{i=1}^{n-1}(-1)^i \dim \operatorname{im}(\varphi_i) + \sum_{i=1}^{n-1}(-1)^i \dim \ker(\varphi_i) \\ &= \sum_{i=1}^{n-1}(-1)^i \dim \ker(\varphi_{i+1}) + \sum_{i=1}^{n-1}(-1)^i \dim \ker(\varphi_i) \\ &= (-1)^{n-1} \dim \underbrace{\ker(\varphi_n)}_{=V_n} + (-1)^1 \dim \underbrace{\ker(\varphi_1)}_{=0} \\ &= -(-1)^n \dim V_n,\end{aligned}$$

or $\sum(-1)^i \dim(V_i) = 0$.
