Chapter 1: The Fundamental Theorem of Arithmetic

In these exercises lower case latin letters a, b, c, \dots, x, y, z represent integers. Prove each of the statement in Exercise 1.1 through 1.6.

Exercise 1.1.

If $(a, b) = 1$ and if $c|a$ and $d|b$, then $(c, d) = 1$.

Proof (Theorem 1.2).

- (1) $(a, b) = 1$ if and only if there are $x, y \in \mathbb{Z}$ such that

$$ax + by = 1$$

(Theorem 1.2). As $c|a$ and $d|b$, there exist $c', d' \in \mathbb{Z}$ such that $cc' = a$ and $dd' = b$.

- (2) Hence

$$\underbrace{c(c'x)}_{:=x'} + \underbrace{d(d'y)}_{:=y'} = 1$$

for some $x', y' \in \mathbb{Z}$. That is, $(c, d) = 1$.

□

Proof (Theorem 1.12).

- (1) Write

$$a = \prod p_i^{a_i}, \quad b = \prod p_i^{b_i}.$$

Here $\min\{a_i, b_i\} = 0$ since $(a, b) = 1$ (Theorem 1.12).

- (2) As $c|a$ and $d|b$,

$$c = \prod p_i^{a'_i}, \quad d = \prod p_i^{b'_i}$$

where $a'_i \leq a_i$ and $b'_i \leq b_i$. As $0 \leq \min\{a'_i, b'_i\} \leq \min\{a_i, b_i\} = 0$, $\min\{a'_i, b'_i\} = 0$. Hence $(c, d) = \prod p_i^{\min\{a'_i, b'_i\}} = 1$ (Theorem 1.12).

□

Exercise 1.2.

If $(a, b) = (a, c) = 1$, then $(a, bc) = 1$.

Proof (Theorem 1.2).

- (1) $(a, b) = (a, c) = 1$ implies that there are $x, y, z, w \in \mathbb{Z}$ such that

$$ax + by = 1, \quad az + cw = 1$$

(Theorem 1.2).

- (2) So

$$1 = (ax + by)(az + cw) = a \underbrace{(axz + byz + cxw)}_{:=x'} + bc \underbrace{(yw)}_{:=y'}$$

for some $x', y' \in \mathbb{Z}$. That is, $(a, bc) = 1$.

□

Proof (Theorem 1.12).

- (1) Write

$$a = \prod p_i^{a_i}, \quad b = \prod p_i^{b_i}, \quad c = \prod p_i^{c_i}.$$

Here $\min\{a_i, b_i\} = \min\{a_i, c_i\} = 0$ since $(a, b) = (a, c) = 1$ (Theorem 1.12). Observe that $bc = \prod p_i^{b_i + c_i}$.

- (2) Show that for all i , $\min\{a_i, b_i + c_i\} = 0$ if $\min\{a_i, b_i\} = \min\{a_i, c_i\} = 0$. Nothing to do if $a_i = 0$. So if $a_i > 0$, we have

$$b_i = c_i = 0 \implies b_i + c_i = 0 \implies \min\{a_i, b_i + c_i\} = 0.$$

- (3) Therefore, $(a, bc) = \prod p_i^{\min\{a_i, b_i + c_i\}} = 1$ (Theorem 1.12).

□

Exercise 1.3.

If $(a, b) = 1$, then $(a^n, b^k) = 1$ for all $n \geq 1, k \geq 1$.

Proof (Theorem 1.2).

- (1) $(a, b) = 1$ implies that there are $x, y \in \mathbb{Z}$ such that

$$ax + by = 1$$

(Theorem 1.2).

(2) Hence

$$\begin{aligned}
1 &= (ax + by)^{n+k-1} \\
&= \sum_{i=0}^{n+k-1} \binom{n+k-1}{i} (ax)^i (by)^{n+k-1-i} \\
&= \sum_{i=0}^{n-1} \binom{n+k-1}{i} (ax)^i (by)^{n+k-1-i} \\
&\quad + \sum_{i=n}^{n+k-1} \binom{n+k-1}{i} (ax)^i (by)^{n+k-1-i} \\
&= b^k y^k \underbrace{\sum_{i=0}^n \binom{n+k-1}{i} (ax)^i (by)^{n-1-i}}_{:=y'} \\
&\quad + a^n x^n \underbrace{\sum_{i=n}^{n+k-1} \binom{n+k-1}{i} (ax)^{i-n} (by)^{n+k-1-i}}_{:=x'}
\end{aligned}$$

for some $x', y' \in \mathbb{Z}$. That is, $(a^n, b^k) = 1$.

□

Proof (Theorem 1.12).

(1) Write

$$a = \prod p_i^{a_i}, \quad b = \prod p_i^{b_i}.$$

Here $\min\{a_i, b_i\} = 0$ since $(a, b) = 1$ (Theorem 1.12).

(2) Observe that

$$a^n = \prod p_i^{na_i}, \quad b^k = \prod p_i^{kb_i}.$$

Here $\min\{na_i, kb_i\} = 0$ (since $a_i = 0 \implies na_i = 0$ and $b_i = 0 \implies kb_i = 0$).
Therefore $(a^n, b^k) = 1$.

□

Exercise 1.11.

Prove that $n^4 + 4$ is composite if $n > 1$.

Proof.

$$n^4 + 4 = \underbrace{((n-1)^2 + 1)}_{>1} \underbrace{((n+1)^2 + 1)}_{>1}$$

since $n > 1$. \square

Exercise 1.15.

Prove that every $n \geq 12$ is the sum of two composite numbers.

Proof. Write $n = 2m$ (resp. $n = 2m + 1$) where $m \in \mathbb{Z}$, $m \geq 6$. Then $n = 8 + 2(m - 4)$ (resp. $n = 9 + 2(m - 4)$) is the sum of two composite numbers. \square

Exercise 1.16. (Mersenne primes)

Prove that if $2^n - 1$ is prime, then n is prime.

Proof. Suppose n is a composite number, then we can write $n = ab$ with $a > 1$, $b > 1$. Hence

$$2^n - 1 = 2^{ab} - 1 = 2^{ab} - 1 = \underbrace{(2^a - 1)}_{>1} \underbrace{\{(2^a)^{b-1} + \dots + 1\}}_{>1}$$

is also a composite number. \square

Exercise 1.17. (Fermat primes)

Prove that if $2^n + 1$ is prime, then n is a power of 2.

Proof. Write $n = 2^a b$ where a is a nonnegative integer and b is odd. Suppose n is not a power of 2, then $b > 1$. Hence

$$2^n + 1 = 2^{2^a b} + 1 = \underbrace{(2^{2^a} + 1)}_{>1} \underbrace{\{2^{2^a(b-1)} - \dots + 1\}}_{>1}$$

is a composite number. (Note that $1 < 2^{2^a(b-1)} < 2^n + 1$ implies that $1 < (2^{2^a(b-1)} - \dots + 1) < 2^n + 1$ too.) \square

Exercise 1.30.

If $n > 1$ prove that the sum

$$\sum_{k=1}^n \frac{1}{k}$$

is not an integer.

Proof.

(1) (Reductio ad absurdum) Suppose

$$H := \sum_{k=1}^n \frac{1}{k}$$

were an integer.

(2) Let s be the largest integer such that $2^s \leq n$. So the integer number

$$\begin{aligned} 2^{s-1}H &= \sum_{k=1}^n \frac{2^{s-1}}{k} \\ &= 2^{s-1} + 2^{s-2} + \frac{2^{s-1}}{3} + 2^{s-3} + \frac{2^{s-1}}{5} + \frac{2^{s-2}}{3} + \cdots + \frac{1}{2} + \cdots . \end{aligned}$$

has only one term of even denominators (as $n > 1$) if we write all terms in irreducible fractions. That is,

$$2^{s-1}H = \frac{1}{2} + \frac{c}{d} \in \mathbb{Z}$$

where $\frac{c}{d}$ is an irreducible fraction with odd d . Hence it suffices to show that $2 \nmid d$ to get a contradiction.

(3) By

$$\frac{1}{2} + \frac{c}{d} = \frac{d+2c}{2d} \in \mathbb{Z}$$

we have $d+2c = 2dd'$ for some $d' \in \mathbb{Z}$. Note that 2 is a prime. So $2 \mid (d+2c)$ or $2 \mid d$, which is absurd.

□

Chapter 2: Arithmetical functions and Dirichlet multiplication

Exercise 2.1.

Find all integers n such that

- (a) $\varphi(n) = \frac{n}{2}$,
- (b) $\varphi(n) = \varphi(2n)$,
- (c) $\varphi(n) = 12$.

Proof of (a).

$$\varphi(n) = n \prod_{p|n} \left(1 - \frac{1}{p}\right) = \frac{n}{2}$$

(Theorem 2.4) implies that $n = 2$. \square

Proof of (b).

- (1) $\varphi(n) = \varphi(2n)$ implies that

$$n \prod_{p|n} \left(1 - \frac{1}{p}\right) = 2n \prod_{p|(2n)} \left(1 - \frac{1}{p}\right).$$

- (2) If $2|n$, then $n = 2n$ or $n = 0$, which is absurd.
- (3) If $2 \nmid n$, then

$$n \prod_{p|n} \left(1 - \frac{1}{p}\right) = 2n \prod_{p|(2n)} \left(1 - \frac{1}{p}\right) = \underbrace{2n \left(1 - \frac{1}{2}\right)}_{=n} \prod_{p|n} \left(1 - \frac{1}{p}\right)$$

is always true. Hence n is odd if $\varphi(n) = \varphi(2n)$.

\square

Proof of (c).

- (1) Show that the solutions of $\varphi(n) = 12$ are $n = 13, 26, 21, 28, 42, 36$. Write $n = p_1^{\alpha_1} \cdots p_r^{\alpha_r}$ where $p_1 < p_2 < \dots$. Then

$$12 = \varphi(n) = \prod_{i=1}^r p_i^{\alpha_i-1} (p_i - 1).$$

(Theorem 2.5). It implies that $p_i \in \{2, 3, 5, 7, 13\}$ if $\alpha_i > 0$. Consider all possible cases of the greatest prime divisor p_r of n as follows.

(2) If $p_r = 13$, then $\alpha_r = 1$ since $13 \nmid 12$. So

$$12 = \varphi(n) = \underbrace{\varphi(13)}_{=12} \varphi\left(\frac{n}{13}\right)$$

or $1 = \varphi\left(\frac{n}{13}\right)$. Hence $\frac{n}{13} = 1, 2$. In this case $n = 13, 26$.

(3) If $p_r = 7$, then $\alpha_r = 1$ since $7 \nmid 12$. So

$$12 = \varphi(n) = \underbrace{\varphi(7)}_{=6} \varphi\left(\frac{n}{7}\right)$$

or $2 = \varphi\left(\frac{n}{7}\right)$. Hence $\frac{n}{7} = 3, 4, 6$. In this case $n = 21, 28, 42$.

(5) If $p_r = 5$, then $\alpha_r = 1$ since $5 \nmid 12$. So $12 = \varphi(5)\varphi\left(\frac{n}{5}\right)$ or $3 = \varphi\left(\frac{n}{5}\right)$, which is impossible.

(6) If $p_r = 3$, then $\alpha_r = 1, 2$. $\alpha_r = 1$ is impossible since $3 \mid 12$. So

$$12 = \varphi(n) = \underbrace{\varphi(3^2)}_{=6} \varphi\left(\frac{n}{3^2}\right)$$

or $2 = \varphi\left(\frac{n}{3^2}\right)$. Hence $\frac{n}{3^2} = 4$. (By assumption $\frac{n}{3^2}$ cannot have any prime factor > 3 .) In this case $n = 36$.

□

Exercise 2.2.

For each of the following statements either give a proof or exhibit a counter example.

- (a) If $(m, n) = 1$ then $(\varphi(m), \varphi(n)) = 1$.
- (b) If n is composite, then $(n, \varphi(n)) > 1$.
- (c) If the same primes divide m and n , then $n\varphi(m) = m\varphi(n)$.

Proof of (a). It is false since $(5, 13) = 1$ and $(\varphi(5), \varphi(13)) = (4, 12) = 4$. □

Proof of (b). It is false since $(15, \varphi(15)) = (15, 8) = 1$. □

Proof of (c).

- (1) It is true.

(2) If the same primes divide m and n , then

$$\frac{\varphi(n)}{n} = \prod_{p|n} \left(1 - \frac{1}{p}\right) = \prod_{p|m} \left(1 - \frac{1}{p}\right) = \frac{\varphi(m)}{m}$$

(Theorem 2.4). Hence $n\varphi(m) = m\varphi(n)$.

□

Exercise 2.3.

Prove that

$$\frac{n}{\varphi(n)} = \sum_{d|n} \frac{\mu(d)^2}{\varphi(d)}.$$

Proof.

(1) Note that fg , f/g and $f * g$ are multiplicative if f and g are multiplicative (Example 5 on page 34 and Theorem 2.14). Hence $\frac{n}{\varphi(n)}$ and $\sum_{d|n} \frac{\mu^2(d)}{\varphi(d)}$ are multiplicative. Hence it might assume that $n = p^a$ for some prime p and integer $a \geq 1$. (The case $n = 1$ is trivial.)

(2)

$$\frac{p^a}{\varphi(p^a)} = \frac{p^a}{p^a - p^{a-1}} = \frac{p}{p-1}.$$

(3)

$$\begin{aligned} \sum_{d|p^a} \frac{\mu(d)^2}{\varphi(d)} &= \frac{\mu(1)^2}{\varphi(1)} + \frac{\mu(p)^2}{\varphi(p)} + \overbrace{\frac{\mu(p^2)^2}{\varphi(p^2)}}^{=0} + \cdots + \overbrace{\frac{\mu(p^a)^2}{\varphi(p^a)}}^{=0} \\ &= 1 + \frac{1}{p-1} + 0 + \cdots + 0 \\ &= \frac{p}{p-1}. \end{aligned}$$

(4) Or apply Theorems 2.4 and 2.18 to get

$$\begin{aligned} \sum_{d|n} \frac{\mu(d)^2}{\varphi(d)} &= \prod_{p|n} \left(1 - \frac{\mu(p)}{\varphi(p)}\right) \\ &= \prod_{p|n} \left(1 - \frac{-1}{p-1}\right) \\ &= \prod_{p|n} \frac{p}{p-1} \\ &= \frac{n}{\varphi(n)}. \end{aligned}$$

□

Exercise 2.4.

Prove that $\varphi(n) > \frac{n}{6}$ for all n with at most 8 distinct prime factors.

Proof.

(1)

$$\begin{aligned}
 \varphi(n) &= n \prod_{p|n} \left(1 - \frac{1}{p}\right) && \text{(Theorem 2.4)} \\
 &\geq n \left(1 - \frac{1}{2}\right) \left(1 - \frac{1}{3}\right) \left(1 - \frac{1}{5}\right) \left(1 - \frac{1}{7}\right) \\
 &\quad \left(1 - \frac{1}{11}\right) \left(1 - \frac{1}{13}\right) \left(1 - \frac{1}{17}\right) \left(1 - \frac{1}{19}\right) \\
 &= \frac{55296}{323323} n \\
 &> \frac{n}{6}.
 \end{aligned}$$

(2) The conclusion does not hold if n has more than 9 distinct prime factors.

□

Exercise 2.5.

Define $\nu(1) = 0$, and for $n > 1$ let $\nu(n)$ be the number of distinct prime factors of n . Let $f = \mu * \nu$ and prove that $f(n)$ is either 0 or 1.

Proof. It is easy to verify that

$$f(n) := \begin{cases} 1 & \text{if } n \text{ is prime,} \\ 0 & \text{otherwise.} \end{cases}$$

satisfies $\sum_{d|n} f(d) = \nu(n)$. Hence $f = \mu * \nu$ holds by the Möbius inversion formula (Theorem 2.9). □

Note. We can calculate $f(n)$ for $n = 1, 2, \dots, 10$ to find the pattern of f .

Exercise 2.6.

Prove that

$$\sum_{d^2|n} \mu(d) = \mu(n)^2$$

and, more generally

$$\sum_{d^k|n} \mu(d) = \begin{cases} 0 & \text{if } m^k|n \text{ for some } m > 1, \\ 1 & \text{otherwise.} \end{cases}$$

The last sum is extended over all positive divisors d of n whose k th power also divide n .

Proof.

- (1) Write $n = p_1^{\alpha_1} \cdots p_r^{\alpha_r} q_1^{\beta_1} \cdots q_s^{\beta_s}$ where $\alpha_i \geq 2$ and $\beta_j = 1$. The proof is similar to Theorem 2.1.
- (2) If $p_1^{\alpha_1} \cdots p_r^{\alpha_r} = 1$, then $\sum_{d^2|n} \mu(n) = \mu(1) = 1$.
- (3) If $p_1^{\alpha_1} \cdots p_r^{\alpha_r} > 1$, then

$$\begin{aligned} \sum_{d^2|n} \mu(d) &= \mu(1) + \mu(p_1) + \cdots + \mu(p_r) \\ &\quad + \mu(p_1 p_2) + \cdots + \mu(p_{r-1} p_r) + \cdots + \mu(p_1 \cdots p_r) \\ &= 1 + \binom{r}{1}(-1) + \binom{r}{2}(-1)^2 + \cdots + \binom{r}{r}(-1)^r \\ &= (1 - 1)^r \\ &= 0. \end{aligned}$$

- (4) By (2)(3), $\sum_{d^2|n} \mu(d) = \mu(n)^2$. Besides, we have

$$\sum_{d^k|n} \mu(d) = \begin{cases} 0 & \text{if } m^k|n \text{ for some } m > 1, \\ 1 & \text{otherwise} \end{cases}$$

by the same argument as (1)(2)(3).

□

Exercise 2.7.

Let $\mu(p, d)$ denote the value of the Möbius function at the gcd of p and d . Prove that for every prime p we have

$$\sum_{d|n} \mu(d) \mu(p, d) = \begin{cases} 1 & \text{if } n = 1, \\ 2 & \text{if } n = p^a, a \geq 1, \\ 0 & \text{otherwise.} \end{cases}$$

Proof.

- (1) It suffices to show that $\mu(p, n)$ is multiplicative. If so, then

$$h(n) := \sum_{d|n} \mu(d)\mu(p, d)$$

is also multiplicative by taking $f(n) := \mu(n)\mu(p, n)$ and $g(n) := 1$ in Theorem 2.14.

- (2) A direct calculation shows that $h(1) = 1$ (or by Theorem 2.12) and

$$h(p^a) = \mu(1)\mu(p, 1) + \mu(p)\mu(p, p) = 1 \cdot 1 + (-1) \cdot (-1) = 2,$$

$$h(q^b) = \mu(1)\mu(p, 1) + \mu(q)\mu(p, q) = 1 \cdot 1 + (-1) \cdot 1 = 0$$

where $q \neq p$ and $a, b \geq 1$. Hence (1) and Theorem 2.13 show that

$$h(n) = \begin{cases} 1 & \text{if } n = 1, \\ 2 & \text{if } n = p^a, a \geq 1, \\ 0 & \text{otherwise.} \end{cases}$$

- (3) Show that $\mu(p, n)$ is multiplicative. Suppose $(m, n) = 1$. There are two possible cases: $p \nmid mn$ and $p|mn$.

(a) If $p \nmid mn$, then all $\mu(p, mn), \mu(p, m), \mu(p, n)$ are equal to $\mu(1) = 1$.

(b) If $p|mn$, then $p|m$ or $p|n$. Note that $(m, n) = 1$ and thus p cannot be a common divisor of m, n . Hence $\mu(p, mn) = \mu(p) = -1$ and $\mu(p, m)\mu(p, n) = \mu(p)\mu(1) = -1$.

In any case $\mu(p, mn) = \mu(p, m)\mu(p, n)$ if $(m, n) = 1$.

□

Exercise 2.8.

Prove that

$$\sum_{d|n} \mu(d)(\log d)^m = 0$$

if $m \geq 1$ and n has more than m distinct prime factors. [Hint: Induction.]

Proof.

- (1) Induction.

(2) (Base case) Suppose $m = 1$. Theorem 2.11 implies that

$$\sum_{d|n} \mu(d) \log(d) = -\Lambda(n) = 0$$

since n has at least 2 distinct prime factors.

(3) (Inductive step) Suppose the conclusion holds for $m < m_0$ and n has more than m distinct prime factors. Given n having more than m_0 distinct prime factors. Write $n = p^a n'$ where $a > 0$ and $p \nmid n'$. (Here q has more than $m_0 - 1$ distinct prime factors.) So by the induction hypothesis and $\sum_{d|n'} \mu(d) = 0$, we have

$$\begin{aligned} & \sum_{d|n} \mu(d) (\log d)^{m_0} \\ &= \sum_{d|n'} \sum_{i=0}^a \mu(p^i d) (\log p^i d)^{m_0} \\ &= \sum_{d|n'} [\mu(d) (\log d)^{m_0} + \mu(pd) (\log pd)^{m_0}] \\ &= \sum_{d|n'} [\mu(d) (\log d)^{m_0} + \underbrace{\mu(p)}_{=-1} \mu(d) (\log p + \log d)^{m_0}] \\ &= \sum_{d|n'} \mu(d) [(\log d)^{m_0} - (\log p + \log d)^{m_0}] \\ &= \sum_{d|n'} \mu(d) [-(\log p)^{m_0} - \dots - m_0 \log p (\log d)^{m_0-1}] \\ &= -(\log p)^{m_0} \sum_{d|n'} \mu(d) - \dots - m_0 \log p \sum_{d|n'} \mu(d) (\log d)^{m_0-1} \\ &= 0. \end{aligned}$$

(4) By (2)(3), the conclusion holds for all $m \geq 1$.

□

Exercise 2.9.

If x is real, $x \geq 1$, let $\varphi(x, n)$ denote the number of positive integers $\leq x$ that are relatively prime to n . [Note that $\varphi(n, n) = \varphi(n)$.] Prove that

$$\varphi(x, n) = \sum_{d|n} \mu(d) \left\lfloor \frac{x}{d} \right\rfloor, \quad \sum_{d|n} \varphi\left(\frac{x}{d}, \frac{n}{d}\right) = [x].$$

Proof.

- (1) Show that $\varphi(x, n) = \sum_{d|n} \mu(d) \left\lfloor \frac{x}{d} \right\rfloor$. Similar to the proof of Theorem 2.3. $\varphi(x, n)$ can be written in the form

$$\varphi(x, n) = \sum_{1 \leq k \leq x} \left\lfloor \frac{1}{(n, k)} \right\rfloor,$$

where now k runs through all integers $\leq x$. Now we use Theorem 2.1 with n replaced by (n, k) to obtain

$$\varphi(x, n) = \sum_{1 \leq k \leq x} \sum_{d|(n, k)} \mu(d) = \sum_{1 \leq k \leq x} \sum_{\substack{d|n \\ d|k}} \mu(d).$$

For a fixed divisor d of n we must sum over all those k in the range $1 \leq k \leq x$ which are multiples of d . If we write $k = qd$ then $1 \leq k \leq x$ if and only if $1 \leq q \leq \left\lfloor \frac{x}{d} \right\rfloor$. Hence the last sum for $\varphi(x, n)$ can be written as

$$\varphi(x, n) = \sum_{d|n} \sum_{1 \leq q \leq \left\lfloor \frac{x}{d} \right\rfloor} \mu(d) = \sum_{d|n} \mu(d) \sum_{1 \leq q \leq \left\lfloor \frac{x}{d} \right\rfloor} 1 = \sum_{d|n} \mu(d) \left\lfloor \frac{x}{d} \right\rfloor.$$

- (2) Show that $\sum_{d|n} \varphi\left(\frac{x}{d}, \frac{n}{d}\right) = [x]$. Similar to the proof of Theorem 2.2. Let S denote the set $\{1, 2, \dots, [x]\}$. We distribute the integers of S into disjoint sets as follows. For each divisor d of n , let

$$A(d) = \{k : (k, n) = d, 1 \leq k \leq x\}.$$

That is, $A(d)$ contains those elements of S which have the gcd d with n . The sets $A(d)$ form a disjoint collection whose union is S . Therefore if $f(d)$ denotes the number of integers in $A(d)$ we have

$$\sum_{d|n} f(d) = [x].$$

But $(k, n) = d$ if and only if $\left(\frac{k}{d}, \frac{n}{d}\right) = 1$, and $0 < k \leq x$ if and only if $0 < \frac{k}{d} \leq \frac{x}{d}$. Therefore, if we let $q = \frac{k}{d}$, there is a one-to-one correspondence between the elements in $A(d)$ and those integers q satisfying $0 < q \leq \frac{x}{d}$, $\left(q, \frac{n}{d}\right) = 1$. The number of such q is $\varphi\left(\frac{x}{d}, \frac{n}{d}\right)$. Hence $f(d) = \varphi\left(\frac{x}{d}, \frac{n}{d}\right)$ and thus

$$\sum_{d|n} \varphi\left(\frac{x}{d}, \frac{n}{d}\right) = [x].$$

□

In Exercise 2.10, 2.11 and 2.12, $d(n)$ denotes the number of positive divisors of n .

Exercise 2.10.

Prove that $\prod_{t|n} t = n^{\frac{d(n)}{2}}$.

Proof.

(1) Note that $d(1) = 1$ and

$$d(p_1^{\alpha_1} \cdots p_r^{\alpha_r}) = (\alpha_1 + 1) \cdots (\alpha_r + 1) = d(p_1^{\alpha_1}) \cdots d(p_r^{\alpha_r}).$$

Hence $d(n)$ is multiplicative (Theorem 2.13).

(2) Show that $\prod_{t|n} t = n^{\frac{d(n)}{2}}$. $n = 1$ is trivial. Assume $n = p_1^{\alpha_1} \cdots p_r^{\alpha_r} > 1$. Then $t|n$ if and only if $t = p_1^{x_1} \cdots p_r^{x_r}$ with $0 \leq x_i \leq \alpha_i$ ($i = 1, \dots, r$). So

$$\begin{aligned} \prod_{t|n} t &= \prod_{\substack{0 \leq x_1 \leq \alpha_1 \\ \vdots \\ 0 \leq x_r \leq \alpha_r}} p_1^{x_1} \cdots p_r^{x_r} \\ &= p_1^{(0+1+\cdots+\alpha_1)(\alpha_2+1)\cdots(\alpha_r+1)} \cdots p_r^{(\alpha_1+1)\cdots(\alpha_{r-1}+1)(0+1+\cdots+\alpha_r)} \\ &= p_1^{\frac{\alpha_1(\alpha_1+1)}{2} \cdot (\alpha_2+1)\cdots(\alpha_r+1)} \cdots p_r^{(\alpha_1+1)\cdots(\alpha_{r-1}+1) \cdot \frac{\alpha_r(\alpha_r+1)}{2}} \\ &= p_1^{\alpha_1 \frac{d(n)}{2}} \cdots p_r^{\alpha_r \frac{d(n)}{2}} \\ &= (p_1^{\alpha_1} \cdots p_r^{\alpha_r})^{\frac{d(n)}{2}} \\ &= n^{\frac{d(n)}{2}}. \end{aligned}$$

□

Exercise 2.11.

Prove that $d(n)$ is odd if, and only if, n is a square.

Proof. $n = 1$ is trivial. Assume $n = p_1^{\alpha_1} \cdots p_r^{\alpha_r} > 1$. Then

$$\begin{aligned} d(n) &= (\alpha_1 + 1) \cdots (\alpha_r + 1) \text{ is odd} && \text{(Exercise 2.10)} \\ \iff \alpha_1 + 1, \dots, \alpha_r + 1 &\text{ are odd} \\ \iff \alpha_1, \dots, \alpha_r &\text{ are even} \\ \iff n &\text{ is a square.} \end{aligned}$$

□

Exercise 2.12.

Prove that $\sum_{t|n} d(t)^3 = \left(\sum_{t|n} d(t) \right)^2$.

Proof.

- (1) Exercise 2.10 shows that $d(n)$ is multiplicative. Similar to the proof of Exercise 2.7, both $f(n) := \sum_{t|n} d(t)^3$ and $g(n) := \left(\sum_{t|n} d(t) \right)^2$ are multiplicative. So it suffices to show that $f(p^a) = g(p^a)$ (Theorem 2.13).
- (2) A direct calculation shows that

$$\begin{aligned} f(p^a) &= \sum_{t|p^a} d(t)^3 \\ &= d(1)^3 + d(p)^3 + \cdots + d(p^a)^3 \\ &= 1^3 + 2^3 + \cdots + (a+1)^3 \\ &= \left(\frac{(a+1)(a+2)}{2} \right)^2 \end{aligned}$$

and

$$\begin{aligned} g(p^a) &= \left(\sum_{t|p^a} d(t) \right)^2 \\ &= (d(1) + d(p) + \cdots + d(p^a))^2 \\ &= (1 + 2 + \cdots + (a+1))^2 \\ &= \left(\frac{(a+1)(a+2)}{2} \right)^2 \end{aligned}$$

are equal.

□

Exercise 2.13. (Product form of the Möbius inversion formula)

Product form of the Möbius inversion formula. If $f(n) > 0$ for all n and if $a(n)$ is real, $a(1) \neq 0$, prove that

$$g(n) = \prod_{d|n} f(d)^{a\left(\frac{n}{d}\right)} \quad \text{if, and only if,} \quad f(n) = \prod_{d|n} g(d)^{b\left(\frac{n}{d}\right)}$$

where $b = a^{-1}$, the Dirichlet inverse of a .

Proof. As $f(n) > 0$ for all n , $a(n)$ is real, and $a(1) \neq 0$, we have

$$\begin{aligned}
\underbrace{\log g(n)}_{\text{well-defined}} &= \sum_{d|n} a\left(\frac{n}{d}\right) \underbrace{\log f(d)}_{\text{well-defined}} \\
&\iff \log g = a * \log f \\
&\iff \log f = b * \log g \\
&\iff \log f(n) = \sum_{d|n} b\left(\frac{n}{d}\right) \log g(d) \\
&\iff f(n) = \prod_{d|n} g(d)^{b\left(\frac{n}{d}\right)}.
\end{aligned}$$

□

Exercise 2.14.

Let $f(x)$ be defined for all rational x in $0 \leq x \leq 1$ and let

$$F(n) = \sum_{1 \leq k \leq n} f\left(\frac{k}{n}\right), \quad F^*(n) = \sum_{\substack{1 \leq k \leq n \\ (k,n)=1}} f\left(\frac{k}{n}\right).$$

- (a) Prove that $F^* = \mu * F$, the Dirichlet product of μ and F .
- (b) Use (a) or some other means to prove that $\mu(n)$ is the of the primitive n th roots of unity:

$$\mu(n) = \sum_{\substack{1 \leq k \leq n \\ (k,n)=1}} e^{\frac{2\pi i k}{n}}.$$

Proof of (a). As $\mu * u = I$, it suffices to show that $u * F^* = F$. Hence

$$\begin{aligned}
(u * F^*)(n) &= \sum_{d|n} F^*(d) \\
&= \sum_{d|n} \sum_{\substack{1 \leq k \leq d \\ (k,d)=1}} f\left(\frac{k}{d}\right) \\
&= \sum_{\substack{d|n \\ 1 \leq k \leq d \\ (k,d)=1}} f\left(\frac{k}{d}\right) \\
&= \sum_{1 \leq k \leq n} f\left(\frac{k}{n}\right) \\
&= F(n).
\end{aligned}$$

□

Proof of (b). Let $f(x) = e^{2\pi i x}$ defined on $[0, 1]$. Then

$$F(n) = \sum_{1 \leq k \leq n} f\left(\frac{k}{n}\right) = \sum_{1 \leq k \leq n} e^{\frac{2\pi i k}{n}} = I(n).$$

Hence

$$\sum_{\substack{1 \leq k \leq n \\ (k, n) = 1}} e^{\frac{2\pi i k}{n}} = F^*(n) = (\mu * F)(n) = (\mu * I)(n) = \mu(n).$$

□

Exercise 2.15. ($\varphi_k(n)$ function)

Let $\varphi_k(n)$ denote the sum of the k th powers of the numbers $\leq n$ and relatively prime to n . Note that $\varphi_0(n) = \varphi(n)$. Use Exercise 2.14 or some other means to prove that

$$\sum_{d|n} \frac{\varphi_k(n)}{d^k} = \frac{1^k + \cdots + n^k}{n^k}.$$

Proof.

(1) Let $f(x) = x^k$ defined on $[0, 1]$. Then

$$F(n) = \sum_{1 \leq i \leq n} f\left(\frac{i}{n}\right) = \frac{1^k + \cdots + n^k}{n^k}.$$

(2) The proof of Exercise 2.14 shows that

$$F(n) = (u * F^*)(n) = \sum_{d|n} \sum_{\substack{1 \leq i \leq d \\ (i, d) = 1}} f\left(\frac{i}{d}\right) = \sum_{d|n} \frac{1}{d^k} \underbrace{\sum_{\substack{1 \leq i \leq d \\ (i, d) = 1}} i^k}_{=\varphi_k(n)}.$$

(3) Hence the result is established by (1)(2).

□

Exercise 2.16.

Invert the formula in Exercise 2.15 to obtain, for $n > 1$,

$$\varphi_1(n) = \frac{1}{2}n\varphi(n), \quad \text{and } \varphi_2(n) = \frac{1}{3}n^2\varphi(n) + \frac{n}{6} \prod_{p|n} (1-p).$$

Derive a corresponding formula for $\varphi_3(n)$.

Proof.

(1) Exercise 2.15 shows that

$$\sum_{d|n} \varphi_k(n) \underbrace{\left(\frac{n}{d}\right)^k}_{:=f\left(\frac{n}{d}\right)} = \underbrace{1^k + \cdots + n^k}_{:=S_k(n)} \iff \varphi_k * f = S_k.$$

Here $f(n) = N(n)^k = n^k$ and $S_k(n) = 1^k + \cdots + n^k$.

(2) As $f(n)$ is completely multiplicative, Theorem 2.17 implies that $f^{-1}(n) = \mu(n)f(n)$ for all $n \geq 1$. Hence

$$\begin{aligned} \varphi_k(n) &= (S_k * f^{-1})(n) \\ &= (S_k * (\mu f))(n) \\ &= \sum_{d|n} S_k(d) \mu\left(\frac{n}{d}\right) \left(\frac{n}{d}\right)^k. \end{aligned}$$

(3) Show that $\varphi_1(n) = \frac{1}{2}n\varphi(n)$. Note that $S_1(d) = \frac{d(d+1)}{2}$. Hence

$$\begin{aligned} \varphi_1(n) &= \sum_{d|n} \frac{d(d+1)}{2} \mu\left(\frac{n}{d}\right) \frac{n}{d} \\ &= \frac{n}{2} \sum_{d|n} d \mu\left(\frac{n}{d}\right) + \frac{n}{2} \sum_{d|n} \mu\left(\frac{n}{d}\right) \\ &= \frac{n}{2} \varphi(n) + \frac{n}{2} \left\lfloor \frac{1}{n} \right\rfloor \quad (\text{Theorems 2.1, 2.3}) \end{aligned}$$

for all $n \geq 1$. So the result is established if $n > 1$.

(4) Show that $\varphi_2(n) = \frac{1}{3}n^2\varphi(n) + \frac{1}{6}n \prod_{p|n} (1-p)$. Note that $S_2(d) = \frac{d(d+1)(2d+1)}{6}$. Hence Theorem 2.1, 2.3 and 2.18 imply that

$$\begin{aligned} \varphi_2(n) &= \sum_{d|n} \frac{d(d+1)(2d+1)}{6} \mu\left(\frac{n}{d}\right) \left(\frac{n}{d}\right)^2 \\ &= \underbrace{\frac{n^2}{3} \sum_{d|n} d \mu\left(\frac{n}{d}\right)}_{=\varphi(n)} + \underbrace{\frac{n^2}{2} \sum_{d|n} \mu\left(\frac{n}{d}\right)}_{=\left\lfloor \frac{1}{n} \right\rfloor} + \underbrace{\frac{n}{6} \sum_{d|n} \mu\left(\frac{n}{d}\right) \left(\frac{n}{d}\right)}_{=\prod_{p|n} (1-p)} \end{aligned}$$

for all $n \geq 1$. So the result is established if $n > 1$.

(4) *Show that*

$$\varphi_3(n) = \frac{1}{4}n^3\varphi(n) + \frac{1}{4}n^2 \prod_{p|n} (1-p).$$

Note that $S_3(d) = \frac{d^2(d+1)^2}{4}$. Hence Theorem 2.1, 2.3 and 2.18 imply that

$$\begin{aligned} \varphi_3(n) &= \sum_{d|n} \frac{d^2(d+1)^2}{4} \mu\left(\frac{n}{d}\right) \left(\frac{n}{d}\right)^3 \\ &= \frac{n^3}{4} \underbrace{\sum_{d|n} d \mu\left(\frac{n}{d}\right)}_{=\varphi(n)} + \frac{n^3}{2} \underbrace{\sum_{d|n} \mu\left(\frac{n}{d}\right)}_{=\lfloor \frac{1}{n} \rfloor} + \frac{n^2}{4} \underbrace{\sum_{d|n} \mu\left(\frac{n}{d}\right) \left(\frac{n}{d}\right)}_{=\prod_{p|n} (1-p)} \end{aligned}$$

for all $n \geq 1$. So the result is established if $n > 1$.

□

Exercise 2.17. (Jordan's totient function)

Jordan's totient J_k is a generalization of Euler's totient defined by

$$J_k(n) = n^k \prod_{p|n} (1 - p^{-k}).$$

(a) *Prove that*

$$J_k(n) = \sum_{d|n} \mu(d) \left(\frac{n}{d}\right)^k \quad \text{and} \quad n^k = \sum_{d|n} J_k(d).$$

(b) *Determine the Bell series for J_k .*

Proof of (a).

(1) *Show that $J_k(n) = \sum_{d|n} \mu(d) \left(\frac{n}{d}\right)^k$.* Similar to Exercise 2.7. Note that J_k is multiplicative. Theorem 2.14 shows that the Dirichlet product $n \mapsto \sum_{d|n} \mu(d) \left(\frac{n}{d}\right)^k$ is multiplicative. Hence it suffices to show that

$$J_k(n) = \sum_{d|n} \mu(d) \left(\frac{n}{d}\right)^k$$

for $n = p^a$ where p is prime and $a \geq 1$. It is easy since

$$\begin{aligned} p^a &\mapsto \sum_{d|p^a} \mu(d) \left(\frac{p^a}{d}\right)^k = \mu(1)p^{ak} + \mu(p)p^{(a-1)k} \\ &= p^{ak} - p^{(a-1)k} \\ &= J_k(p^a). \end{aligned}$$

- (2) Show that $n^k = \sum_{d|n} J_k(d)$. Note that $\mu * u = I$ by Theorem 2.1. So Theorem 2.9 (Möbius inversion formula) implies that

$$n^k = J_k * u = \sum_{d|n} J_k(d).$$

□

Proof of (b).

- (1) Since $J_k(1) = 1$ and $J_k(p^n) = p^{nk} - p^{(n-1)k}$ for $n \geq 1$, we have

$$\begin{aligned} (J_k)_p(x) &= \sum_{n=0}^{\infty} J_k(p^n) x^n \\ &= 1 + \sum_{n=0}^{\infty} (p^{nk} - p^{(n-1)k}) x^n \\ &= \sum_{n=0}^{\infty} p^{nk} x^n - x \sum_{n=0}^{\infty} p^{nk} x^n \\ &= (1-x) \sum_{n=0}^{\infty} p^{nk} x^n \\ &= \frac{1-x}{1-p^k x}. \end{aligned}$$

- (2) Another proof by using Theorem 2.25. Note that $\mu_p(x) = 1-x$ and $N_p^k(x) = \frac{1}{1-p^k x}$. Theorem 2.25 implies $(J_k)_p(x) = \mu_p(x) N_p^k(x) = \frac{1-x}{1-p^k x}$ too.

□

Exercise 2.18.

Prove that every number of the form $2^{a-1}(2^a - 1)$ is perfect if $2^a - 1$ is prime.

Proof. Write $n := 2^{a-1}(2^a - 1)$. Here $(2^{a-1}, 2^a - 1) = 1$ since $2^a - 1$ is always odd and Exercise 1.3. Hence

$$\begin{aligned} \sigma(n) &= \sigma(2^{a-1})\sigma(2^a - 1) && (\sigma \text{ is a multiplicative}) \\ &= (1 + 2 + \cdots + 2^{a-1})\{1 + (2^a - 1)\} && (2^a - 1 \text{ is prime}) \\ &= (2^a - 1) \cdot \underbrace{(2^a)}_{=2^{a-1} \cdot 2} \\ &= 2n. \end{aligned}$$

Therefore n is perfect. \square

Exercise 2.19.

Prove that if n is even and perfect then $n = 2^{a-1}(2^a - 1)$ for some $a \geq 2$. It is not known if any odd perfect numbers exist. It is known that there are no odd perfect numbers with less than 7 distinct prime factors.

Proof.

- (1) Suppose n is even and perfect. We might write $n = 2^{a-1}q$ for some $a \geq 2$ and $2 \nmid q$. As n is perfect, we have

$$\begin{aligned} 2n &= \sigma(n) \\ \implies \underbrace{2 \cdot 2^{a-1}q}_{=2^a q} &= 2n = \sigma(2^{a-1}q) = \underbrace{\sigma(2^{a-1})}_{=2^a-1} \sigma(q) \\ \implies 2^a q &= (2^a - 1)\sigma(q) \\ \implies q &= (2^a - 1)q_1 \text{ for some } q_1 \text{ since } (2^a - 1, 2^a) = 1 \\ \implies 2^a(2^a - 1)q_1 &= (2^a - 1)\sigma(q) \\ \implies 2^a q_1 &= \sigma(q) = \sigma((2^a - 1)q_1). \end{aligned}$$

- (2) If $q_1 > 1$, then

$$\begin{aligned} 2^a q_1 &= \sigma(q) \\ &= \sigma((2^a - 1)q_1) \\ &\geq (2^a - 1)q_1 + (2^a - 1) + q_1 + 1 \\ &= 2^a q_1 + 2^a, \end{aligned}$$

which is absurd. Therefore $q_1 = 1$. So $q = 2^a - 1$ and thus $n = 2^a(2^a - 1)$.

- (3) Pace P. Nielsen shows that

- (a) An odd perfect number n is shown to have at least 9 distinct prime factors.
- (b) Moreover, if $3 \nmid n$ then n must have at least 12 distinct prime divisors.

See [Pace P. Nielsen, *Odd perfect numbers have at least nine distinct prime factors*, 2006].

\square

Exercise 2.20.

Let $P(n)$ be the product of the positive integers which are $\leq n$ and relatively prime to n . Prove that

$$P(n) = n^{\varphi(n)} \prod_{d|n} \left(\frac{d!}{d^d} \right)^{\mu\left(\frac{n}{d}\right)}.$$

Proof.

- (1) To prove $\frac{P(n)}{n^{\varphi(n)}} = \prod_{d|n} \left(\frac{d!}{d^d} \right)^{\mu\left(\frac{n}{d}\right)}$, it suffices to show that

$$\frac{n!}{n^n} = \prod_{d|n} \frac{P(d)}{d^{\varphi(d)}}$$

by product form of the Möbius inversion formula (Exercise 2.13).

- (2) Similar to Exercise 2.14,

$$\frac{n!}{n^n} = \prod_{1 \leq k \leq n} \frac{k}{n} = \prod_{d|n} \prod_{\substack{1 \leq k \leq d \\ (k,d)=1}} \frac{k}{d} = \prod_{d|n} \frac{P(d)}{d^{\varphi(d)}}.$$

□

Exercise 2.21.

Let $f(n) = \lfloor \sqrt{n} \rfloor - \lfloor \sqrt{n-1} \rfloor$. Prove that f is multiplicative but not completely multiplicative.

Proof.

- (1) Show that

$$f(n) = \begin{cases} 1 & \text{if } n \text{ is a square,} \\ 0 & \text{otherwise.} \end{cases}$$

- (a) Write $m = \lfloor \sqrt{n} \rfloor$. So $m^2 \leq n < (m+1)^2$.
 (b) Suppose $n = m^2$ is a square. Since $m \geq 1$ and $(m-1)^2 \leq m^2 - 1 = n - 1 < m^2$, $\lfloor \sqrt{n-1} \rfloor = m - 1$. Therefore $f(n) = 1$.
 (c) Suppose n is not a square. So $m^2 < n < (m+1)^2$. So $\lfloor \sqrt{n-1} \rfloor = m$ since $m^2 \leq n - 1 < n < (m+1)^2$. Therefore $f(n) = 0$.
- (2) It is easy to see that f is multiplicative but not completely multiplicative (since $f(p^2) \neq f(p)^2$ for all prime p).

□

Exercise 2.23.

Prove the following statement or exhibit a counter example. If f is multiplicative, then $F(n) = \prod_{d|n} f(d)$ is multiplicative.

Proof.

- (1) False.
- (2) Take a completely multiplicative function $f = N$ defined by $f(n) = n$. Then F is not multiplicative since $pq = F(p)F(q) \neq F(pq) = p^2q^2$ for any two distinct primes p, q .
- (3) Or take a multiplicative function $f = \varphi$. Then F is not multiplicative since $(p-1)(q-1) = F(p)F(q) \neq F(pq) = (p-1)^2(q-1)^2$ for any two distinct primes p, q .

□

Exercise 2.24.

Let $A(x)$ and $B(x)$ be formal power series. If the product $A(x)B(x)$ is the zero series, prove that at least one factor is zero. In other words, the ring of formal power series has no zero divisors.

Proof.

- (1) Write $A(x) = \sum_{n=0}^{\infty} a(n)x^n$ and $B(x) = \sum_{n=0}^{\infty} b(n)x^n$ where the coefficients $a(n)$ and $b(n)$ are in \mathbb{C} (or any integral domain).
- (2) (Reductio ad absurdum) Suppose $A(x) \neq 0$ and $B(x) \neq 0$. Let r (resp. s) be the smallest integer such that $a(r) \neq 0$ (resp. $b(s) \neq 0$). Hence

$$A(x)B(x) = a(r)b(s)x^{r+s} + \dots$$

Here there is no x^n term if $n < r + s$. So $A(x)B(x) = 0$ implies that $a(r)b(s) = 0$. Hence $a(r) = 0$ or $b(s) = 0$ (as \mathbb{C} is an integral domain), which is absurd.

□

Supplement 2.24.1. (Related exercises)

- (1) (Exercise 1.2 in the textbook: Atiyah and Macdonald, *Introduction to Commutative Algebra*.) Let A be a ring and let $A[x]$ be the ring of polynomials in an indeterminate x , with coefficients in A . Let $f = a_0 + a_1x + \cdots + a_nx^n \in A[x]$. Prove that
 - (i) f is a unit in $A[x]$ if and only if a_0 is a unit in A and a_1, \dots, a_n are nilpotent. (Hint: If $b_0 + b_1x + \cdots + b_mx^m$ is the inverse of f , prove by induction on r that $a_n^{r+1}b_{m-r} = 0$. Hence show that a_n is nilpotent, and then use Exercise 1.1.)
 - (ii) f is nilpotent if and only if a_0, a_1, \dots, a_n are nilpotent.
 - (iii) f is a zero-divisor if and only if there exists $a \neq 0$ such that $af = 0$. (Hint: Choose a polynomial $g = b_0 + b_1x + \cdots + b_mx^m$ of least degree m such that $fg = 0$. Then $a_nb_m = 0$, hence $a_ng = 0$ (because a_ng annihilates f and has degree $< m$). Now show by induction that $a_{n-r}g = 0$ ($0 \leq r \leq n$).)
 - (iv) f is said to be **primitive** if $(a_0, a_1, \dots, a_n) = (1)$. Prove that if $f, g \in A[x]$, then fg is primitive if and only if f and g are primitive.
- (2) (Exercise 1.3 in the textbook: Atiyah and Macdonald, *Introduction to Commutative Algebra*.) Generalize the results of Exercise 1.2 to a polynomial ring $A[x_1, \dots, x_r]$ in several indeterminates.
- (3) (Exercise 1.5 in the textbook: Atiyah and Macdonald, *Introduction to Commutative Algebra*.) Let A be a ring and let $A[[x]]$ be the ring of formal power series $f = \sum_{n=0}^{\infty} a_nx^n$ with coefficients in A . Show that
 - (i) f is a unit in $A[[x]]$ if and only if a_0 is a unit in A .
 - (ii) If f is nilpotent, then a_n is nilpotent for all $n \geq 0$. Is converse true? (See Exercise 7.2.)
 - (iii) f belongs to the Jacobson radical of $A[[x]]$ if and only if a_0 belongs to the Jacobson radical of A .
 - (iv) The contraction of a maximal ideal \mathfrak{m} of $A[[x]]$ is a maximal ideal of A , and \mathfrak{m} is generated by \mathfrak{m}^c and x .
 - (v) Every prime ideal of A is the contraction of a prime ideal of $A[[x]]$.
- (4) (Exercise II.1.2 in the textbook: Jrgen Neukirch, *Algebraic Number Theory*.) A p -adic integer $a = a_0 + a_1p + a_2p^2 + \cdots$ is a unit in the ring \mathbb{Z}_p if and only if $a_0 \neq 0$.

Exercise 2.25.

Assume f is multiplicative. Prove that:

- (a) $f^{-1}(n) = \mu(n)f(n)$ for every squarefree n .
- (b) $f^{-1}(p^2) = f(p)^2 - f(p^2)$ for every prime p .

Proof of (a).

- (1) A direct calculation shows that

$$\begin{aligned}
 ((\mu f) * f)(n) &= \sum_{d|n} \mu(d)f(d)f\left(\frac{n}{d}\right) \\
 &= \sum_{d|n} \mu(d)f(n) \\
 &= f(n) \sum_{d|n} \mu(d) \\
 &= f(n)I(n) \\
 &= I(n).
 \end{aligned}$$

The second equality holds since f is multiplicative and $(d, \frac{n}{d}) = 1$ as n is squarefree. The last equality holds since $f(1) = 1$ as f is multiplicative.

- (2) Or we can apply Theorem 2.8 with induction. If $n = 1$, the conclusion holds trivially. Suppose the conclusion holds for every squarefree less than n where $n > 1$. Then Theorem 2.8 implies that

$$\begin{aligned}
 f^{-1}(n) &= \frac{-1}{f(1)} \sum_{\substack{d|n \\ d < n}} f\left(\frac{n}{d}\right) f^{-1}(d) \\
 &= \frac{-1}{f(1)} \sum_{\substack{d|n \\ d < n}} f\left(\frac{n}{d}\right) \mu(d)f(d) \quad (\text{Induction hypothesis}) \\
 &= - \sum_{\substack{d|n \\ d < n}} \mu(d) \underbrace{f\left(\frac{n}{d}\right) f(d)}_{=f(n)} \\
 &= -f(n) \sum_{\substack{d|n \\ d < n}} \mu(d) \\
 &= -f(n)(I(n) - \mu(n)) \\
 &= f(n)\mu(n).
 \end{aligned}$$

□

Proof of (b).

- (1) Note that $f(1) = f^{-1}(1) = 1$ since f is multiplicative. Theorem 2.8 shows that

$$\begin{aligned}
 f^{-1}(p^2) &= \frac{-1}{f(1)} \{f(p^2)f^{-1}(1) + f(p)f^{-1}(p)\} \\
 &= -f(p^2) - f(p)f^{-1}(p) \\
 &= -f(p^2) - f(p)\underbrace{\mu(p)}_{=-1}f(p) && \text{(Part (a))} \\
 &= f(p)^2 - f(p^2).
 \end{aligned}$$

- (2) Note that Theorem 2.8 also shows that

$$f^{-1}(p) = -\frac{1}{f(1)}f(p)f^{-1}(1) = -f(p).$$

Thus we can prove part (b) without using part (a).

□

Chapter 3: Average of arithmetical functions

Exercise 3.1.

Use Euler's summation formula to deduce the following for $x \geq 2$:

- (a) $\sum_{n \leq x} \frac{\log n}{n} = \frac{1}{2}(\log x)^2 + A + O\left(\frac{\log x}{x}\right)$, where A is a constant.
- (b) $\sum_{2 \leq n \leq x} \frac{1}{n \log n} = \log \log x + B + O\left(\frac{1}{x \log x}\right)$, where B is a constant.

Proof of (a).

- (1) Similar to the proof of Theorem 3.2. We take $f(t) = \frac{\log t}{t}$ in Euler's summation formula to obtain

$$\begin{aligned} \sum_{n \leq x} \frac{\log n}{n} &= \int_1^x \frac{\log t}{t} dt + \int_1^x (t - [t]) \frac{1 - \log t}{t^2} dt \\ &\quad + \frac{\log x}{x}([x] - x) - \underbrace{\frac{\log(1)}{1}([1] - 1)}_{=0} \\ &= \frac{1}{2}(\log x)^2 + \int_1^x (t - [t]) \frac{1 - \log t}{t^2} dt + O\left(\frac{\log x}{x}\right) \\ &= \frac{1}{2}(\log x)^2 + \int_1^\infty (t - [t]) \frac{1 - \log t}{t^2} dt \\ &\quad - \int_x^\infty (t - [t]) \frac{1 - \log t}{t^2} dt + O\left(\frac{\log x}{x}\right). \end{aligned}$$

- (2) The improper integral $\int_1^\infty (t - [t]) \frac{1 - \log t}{t^2} dt$ exists since it is dominated by $\int_1^e \frac{1 - \log t}{t^2} dt + \int_e^\infty \frac{\log t - 1}{t^2} dt = 2e^{-1}$.
- (3) Might assume that $x \geq e$. So

$$0 \leq - \int_x^\infty (t - [t]) \frac{1 - \log t}{t^2} dt \leq \int_x^\infty \frac{\log t - 1}{t^2} dt = \frac{\log x}{x}.$$

- (4) Therefore

$$\sum_{n \leq x} \frac{\log n}{n} = \frac{1}{2}(\log x)^2 + A + O\left(\frac{\log x}{x}\right)$$

where $A = \int_1^\infty (t - [t]) \frac{1 - \log t}{t^2} dt$ is a constant.

□

Proof of (b).

(1) We take $f(t) = \frac{1}{t \log t}$ in Euler's summation formula to obtain

$$\begin{aligned}
\sum_{2 \leq n \leq x} \frac{1}{n \log n} &= \int_2^x \frac{1}{t \log t} dt + \int_2^x -(t - [t]) \frac{\log t + 1}{t^2 (\log t)^2} dt \\
&\quad + \frac{1}{x \log x} ([x] - x) - \underbrace{\frac{1}{2 \cdot \log(2)} ([2] - 2)}_{=0} \\
&= \log \log x - \log \log 2 - \int_2^x (t - [t]) \frac{\log t + 1}{t^2 (\log t)^2} dt \\
&\quad + O\left(\frac{1}{x \log x}\right) \\
&= \log \log x - \log \log 2 - \int_2^\infty (t - [t]) \frac{\log t + 1}{t^2 (\log t)^2} dt \\
&\quad + \int_x^\infty (t - [t]) \frac{\log t + 1}{t^2 (\log t)^2} dt + O\left(\frac{1}{x \log x}\right).
\end{aligned}$$

(2) The improper integral $\int_2^\infty (t - [t]) \frac{\log t + 1}{t^2 (\log t)^2} dt$ exists since it is dominated by $\int_2^\infty \frac{\log t + 1}{t^2 (\log t)^2} dt = \frac{1}{2 \log 2} < \infty$.

(3)

$$0 \leq \int_x^\infty (t - [t]) \frac{\log t + 1}{t^2 (\log t)^2} dt \leq \int_x^\infty \frac{\log t + 1}{t^2 (\log t)^2} dt = \frac{1}{x \log x}.$$

(4) Therefore

$$\sum_{2 \leq n \leq x} \frac{1}{n \log n} = \log \log x + B + O\left(\frac{1}{x \log x}\right)$$

where $B = -\log \log 2 - \int_2^\infty (t - [t]) \frac{\log t + 1}{t^2 (\log t)^2} dt$ is a constant.

□

Exercise 3.2.

If $x \geq 2$ prove that

$$\sum_{n \leq x} \frac{d(n)}{n} = \frac{1}{2} (\log x)^2 + 2C \log x + O(1),$$

where C is Euler's constant.

Proof. Similar to the proof of Theorem 3.3, we have

$$\sum_{n \leq x} \frac{d(n)}{n} = \sum_{n \leq x} \frac{1}{n} \sum_{d|n} 1 = \sum_{\substack{q, d \\ qd \leq x}} \frac{1}{qd} = \sum_{d \leq x} \frac{1}{d} \sum_{q \leq \frac{x}{d}} \frac{1}{q}.$$

Now we use Theorem 3.2(a) to obtain

$$\sum_{q \leq \frac{x}{d}} \frac{1}{q} = \log \frac{x}{d} + C + O\left(\frac{d}{x}\right) = \log x - \log d + C + O\left(\frac{d}{x}\right).$$

Using this along with Theorem 3.2(a) and Exercise 3.1 we find

$$\begin{aligned} \sum_{n \leq x} \frac{d(n)}{n} &= \sum_{d \leq x} \frac{1}{d} \left\{ \log x - \log d + C + O\left(\frac{d}{x}\right) \right\} \\ &= (\log x + C) \sum_{d \leq x} \frac{1}{d} - \sum_{d \leq x} \frac{\log d}{d} + \sum_{d \leq x} O\left(\frac{1}{x}\right) \\ &= (\log x + C) \left\{ \log x + C + O\left(\frac{1}{x}\right) \right\} \\ &\quad - \left\{ \frac{1}{2}(\log x)^2 + A + O\left(\frac{\log x}{x}\right) \right\} + O(1) \\ &= (\log x)^2 + 2C \log x - \frac{1}{2}(\log x)^2 + O(1) \\ &= \frac{1}{2}(\log x)^2 + 2C \log x + O(1). \end{aligned}$$

□

Exercise 3.3.

If $x \geq 2$ and $\alpha > 0$, $\alpha \neq 1$, prove that

$$\sum_{n \leq x} \frac{d(n)}{n^\alpha} = \frac{x^{1-\alpha} \log x}{1-\alpha} + \zeta(\alpha)^2 + O(x^{1-\alpha}).$$

Proof.

(1) Similar to Exercise 3.2.

$$\sum_{n \leq x} \frac{d(n)}{n^\alpha} = \sum_{n \leq x} \frac{1}{n^\alpha} \sum_{d|n} 1 = \sum_{\substack{q, d \\ qd \leq x}} \frac{1}{q^\alpha d^\alpha} = \sum_{d \leq x} \frac{1}{d^\alpha} \sum_{q \leq \frac{x}{d}} \frac{1}{q^\alpha}.$$

Now we use Theorem 3.2(b) to obtain

$$\sum_{q \leq \frac{x}{d}} \frac{1}{q^\alpha} = \frac{1}{d^{1-\alpha}} \cdot \frac{x^{1-\alpha}}{1-\alpha} + \zeta(\alpha) + O\left(\frac{d^\alpha}{x^\alpha}\right).$$

Using this along with Theorem 3.2 we find

$$\begin{aligned}
\sum_{n \leq x} \frac{d(n)}{n^\alpha} &= \sum_{d \leq x} \frac{1}{d^\alpha} \left\{ \frac{1}{d^{1-\alpha}} \cdot \frac{x^{1-\alpha}}{1-\alpha} + \zeta(\alpha) + O\left(\frac{d^\alpha}{x^\alpha}\right) \right\} \\
&= \frac{x^{1-\alpha}}{1-\alpha} \sum_{d \leq x} \frac{1}{d} + \zeta(\alpha) \sum_{d \leq x} \frac{1}{d^\alpha} + \sum_{d \leq x} O(x^{-\alpha}) \\
&= \frac{x^{1-\alpha}}{1-\alpha} \{\log x + C + O(x^{-1})\} \\
&\quad + \zeta(\alpha) \left\{ \frac{x^{1-\alpha}}{1-\alpha} + \zeta(\alpha) + O(x^{-\alpha}) \right\} + O(x^{1-\alpha}) \\
&= \frac{x^{1-\alpha} \log x}{1-\alpha} + \zeta(\alpha)^2 + O(x^{1-\alpha}).
\end{aligned}$$

□

Exercise 3.5.

If $x \geq 1$ prove that:

- (a) $\sum_{n \leq x} \varphi(n) = \frac{1}{2} \sum_{n \leq x} \mu(n) \left[\frac{x}{n} \right]^2 + \frac{1}{2}.$
- (b) $\sum_{n \leq x} \frac{\varphi(n)}{n} = \sum_{n \leq x} \frac{\mu(n)}{n} \left[\frac{x}{n} \right].$

These formulas, together with those in Exercise 3.4, show that, for $x \geq 2$,

$$\sum_{n \leq x} \varphi(n) = \frac{1}{2} \frac{x^2}{\zeta(2)} + O(x \log x), \quad \sum_{n \leq x} \frac{\varphi(n)}{n} = \frac{x}{\zeta(2)} + O(\log x).$$

The last two formulas are trivial and we omit the proof.

Proof of (a). Same as the proof of Theorem 3.7.

$$\begin{aligned}
\sum_{n \leq x} \varphi(n) &= \sum_{n \leq x} \sum_{d|n} \mu(d) \frac{n}{d} \\
&= \sum_{\substack{q, d \\ qd \leq x}} \mu(d) q \\
&= \sum_{d \leq x} \mu(d) \sum_{q \leq \frac{x}{d}} q \\
&= \sum_{d \leq x} \mu(d) \frac{1}{2} \left[\frac{x}{d} \right] \left(1 + \left[\frac{x}{d} \right] \right) \\
&= \frac{1}{2} \sum_{d \leq x} \mu(d) \left[\frac{x}{d} \right]^2 + \frac{1}{2} \sum_{d \leq x} \mu(d) \left[\frac{x}{d} \right] \\
&= \frac{1}{2} \sum_{d \leq x} \mu(d) \left[\frac{x}{d} \right]^2 + \frac{1}{2} \quad (\text{Theorem 3.12})
\end{aligned}$$

□

Proof of (b).

(1)

$$\begin{aligned}
\sum_{n \leq x} \frac{\varphi(n)}{n} &= \sum_{n \leq x} \sum_{d|n} \frac{\mu(d)}{d} \quad (\text{Theorem 2.3}) \\
&= \sum_{n \leq x} \frac{\mu(n)}{n} \left[\frac{x}{n} \right]. \quad (\text{Theorem 3.11})
\end{aligned}$$

□

Properties of the greatest-integer function

Note. We might define

$$\begin{aligned}
\lfloor x \rfloor &= \text{the greatest integer less than or equal to } x; \\
\lceil x \rceil &= \text{the least integer greater than or equal to } x.
\end{aligned}$$

Kenneth E. Iverson introduced this notation, as well as the names “floor” and “ceiling,” early in the 1960s [Kenneth E. Iverson, *A Programming Language*. Wiley, 1962. page 12].

Exercise 3.17.

Prove that $\lfloor x \rfloor + \lfloor x + \frac{1}{2} \rfloor = \lfloor 2x \rfloor$ and more generally,

$$\sum_{k=0}^{n-1} \left\lfloor x + \frac{k}{n} \right\rfloor = \lfloor nx \rfloor.$$

Proof.

(1) Show that

$$m = \sum_{k=0}^{n-1} \left\lfloor \frac{m+k}{n} \right\rfloor$$

for $n, m \in \mathbb{Z}$ and $n > 0$. Note that

$$m+k = n \left\lfloor \frac{m+k}{n} \right\rfloor + \underbrace{\{(m+k) \bmod n\}}_{:=r(m+k)}$$

for $k = 0, \dots, n-1$ where $0 \leq r(m+k) < n$ is an integer. Note that $\{r(m+k) : k = 0, \dots, n-1\}$ is a rearrangement of $\{0, \dots, n-1\}$. So

$$\begin{aligned} \sum_{k=0}^{n-1} (m+k) &= \sum_{k=0}^{n-1} n \left\lfloor \frac{m+k}{n} \right\rfloor + \sum_{k=0}^{n-1} r(m+k) \\ \implies nm + \sum_{k=0}^{n-1} k &= n \sum_{k=0}^{n-1} \left\lfloor \frac{m+k}{n} \right\rfloor + \sum_{k=0}^{n-1} k \\ \implies m &= \sum_{k=0}^{n-1} \left\lfloor \frac{m+k}{n} \right\rfloor. \end{aligned}$$

(2) Show that $\lfloor \frac{m+x}{n} \rfloor = \left\lfloor \frac{m+\lfloor x \rfloor}{n} \right\rfloor$ if $n, m \in \mathbb{Z}$, $n > 0$ and $x \in \mathbb{R}$. Similar to (1), we write

$$m + \lfloor x \rfloor = n \left\lfloor \frac{m + \lfloor x \rfloor}{n} \right\rfloor + r$$

where $0 \leq r < n$ is an integer. So

$$m + x = n \left\lfloor \frac{m + \lfloor x \rfloor}{n} \right\rfloor + (r + x - \lfloor x \rfloor).$$

Note that $0 \leq r + x - \lfloor x \rfloor < n$. Hence

$$\left\lfloor \frac{m+x}{n} \right\rfloor = \left\lfloor \frac{m + \lfloor x \rfloor}{n} \right\rfloor.$$

(3) Now take $m := \lfloor nx \rfloor$ in (1) and apply (2) to get the desired conclusion.

□

Supplement 3.17.1. (Related exercises)

Related exercises are quoted from the book: Ronald L. Graham, Donald E. Knuth and Oren Patashnik, *Concrete Mathematics: A Foundation for Computer Science*, 2nd edition.

(1) Show that $\lceil \frac{m+x}{n} \rceil = \left\lceil \frac{m+\lceil x \rceil}{n} \right\rceil$ if $n, m \in \mathbb{Z}$, $n > 0$ and $x \in \mathbb{R}$.

(2) Show that

$$m = \sum_{k=0}^{n-1} \left\lceil \frac{m-k}{n} \right\rceil$$

for $n, m \in \mathbb{Z}$ and $n > 0$.

(3) Prove that $\lceil x \rceil + \lceil x - \frac{1}{2} \rceil = \lceil 2x \rceil$ and more generally,

$$\sum_{k=0}^{n-1} \left\lceil x + \frac{k}{n} \right\rceil = \lceil nx \rceil.$$

(4) Show that

$$\sum_{k=0}^{n-1} \left\lfloor \frac{mk+x}{n} \right\rfloor = g \left\lfloor \frac{x}{g} \right\rfloor + \frac{1}{2}(mn - m - n + g)$$

if $n, m \in \mathbb{Z}$, $n > 0$, $x \in \mathbb{R}$ and $g = \gcd(m, n)$.

(5) (Reciprocity law) Hence

$$\sum_{k=0}^{n-1} \left\lfloor \frac{mk+x}{n} \right\rfloor = \sum_{k=0}^{m-1} \left\lfloor \frac{nk+x}{m} \right\rfloor$$

if $m, n > 0$.

(6) Prove that, for all real x and y with $y > 0$

$$\sum_{0 \leq k < y} \left\lfloor x + \frac{k}{y} \right\rfloor = \lfloor xy + \lfloor x+1 \rfloor (\lceil y \rceil - y) \rfloor.$$

Exercise 3.18. (Replicative function)

Let $f(x) = x - \lfloor x \rfloor - \frac{1}{2}$. Prove that

$$\sum_{k=0}^{n-1} f\left(x + \frac{k}{n}\right) = f(nx)$$

and deduce that

$$\left| \sum_{n=1}^m f\left(2^n x + \frac{1}{2}\right) \right| \leq 1 \quad \text{for all } m \geq 1 \text{ and all real } x.$$

Proof.

- (1) Exercise 3.17 shows that $x \mapsto \lfloor x \rfloor$ is replicative. Besides, $x \mapsto x - \frac{1}{2}$ is also replicative. (It is easy to check.) Hence $f : x \mapsto x - \lfloor x \rfloor - \frac{1}{2}$ is replicative.
- (2) In particular, we have

$$f(2^n x) + f\left(2^n x + \frac{1}{2}\right) = f(2^{n+1} x).$$

Hence

$$\begin{aligned} \sum_{n=1}^m f\left(2^n x + \frac{1}{2}\right) &= \sum_{n=1}^m \{f(2^{n+1} x) - f(2^n x)\} \\ &= f(2^{m+1} x) - f(2x) \\ &= \underbrace{(2^{m+1} x - \lfloor 2^{m+1} x \rfloor)}_{:=r_1} - \underbrace{(2x - \lfloor 2x \rfloor)}_{:=r_2}. \end{aligned}$$

Since $0 \leq r_1, r_2 < 1$, $-1 < r_1 - r_2 < 1$. Therefore

$$\left| \sum_{n=1}^m f\left(2^n x + \frac{1}{2}\right) \right| < 1.$$

□

Note.

- (1) The function $f(x)$ is said to be **replicative** if it satisfies

$$f(nx) = \sum_{k=0}^{n-1} f\left(x + \frac{k}{n}\right).$$

- (2) The function $x \mapsto f(x - \lfloor x \rfloor)$ is replicative if f is replicative.
- (3) It may be interesting to study more general class of functions for which

$$\sum_{k=0}^{n-1} f\left(x + \frac{k}{n}\right) = a_n f(nx) + b_n$$

(where a_n, b_n do not depend on x).

- (4) Let B_n be the Bernoulli polynomial. Suppose n and F are integers and $n, F > 0$. Show that

$$B_n(Fx) = F^{n-1} \sum_{a=0}^{F-1} B_n\left(x + \frac{a}{F}\right).$$

- (5) Note that

$$\frac{1}{\exp(nz) - 1} = \frac{1}{n} \sum_{k=0}^{n-1} \frac{1}{\exp\left(z + \frac{2k\pi i}{n}\right) - 1}.$$

Thus

$$\cot(z) = \frac{1}{n} \sum_{k=0}^{n-1} \cot \frac{z + k\pi}{n}.$$

Now $x \mapsto \cot(\pi x)$ is replicative.

Exercise 3.20.

If n is a positive integer prove that $\lfloor \sqrt{n} + \sqrt{n+1} \rfloor = \lfloor \sqrt{4n+2} \rfloor$.

Proof.

- (1) Note that

$$\begin{aligned} (\sqrt{n} + \sqrt{n+1})^2 &= 2n + 1 + 2\sqrt{n(n+1)} \\ \implies 4n + 1 &< (\sqrt{n} + \sqrt{n+1})^2 < 4n + 2 \end{aligned}$$

since

$$n = \sqrt{n^2} < \sqrt{n(n+1)} < \sqrt{(n+1)^2} = n + 1.$$

- (2) Hence to show $\lfloor \sqrt{n} + \sqrt{n+1} \rfloor = \lfloor \sqrt{4n+2} \rfloor$, it suffices to show that there is no integers in

$$[\sqrt{n} + \sqrt{n+1}, \sqrt{4n+2}] \subseteq (\sqrt{4n+1}, \sqrt{4n+2}] \subseteq \mathbb{R}^1.$$

So it suffices to show that there is no squares of \mathbb{Z} in the subset

$$(4n + 1, 4n + 2] \subseteq \mathbb{R}^1.$$

Note that $4n + 2$ cannot be an integer square. So the last statement holds. Therefore $\lfloor \sqrt{n} + \sqrt{n+1} \rfloor = \lfloor \sqrt{4n+2} \rfloor$.

□

Chapter 4: Some Elementary Theorems on the Distribution of Prime Numbers

Exercise 4.5.

Prove that for every $n > 1$ there exist n consecutive composite numbers.

Proof.

$$\underbrace{(n + 8964)! + 2}_{\text{is divided by 2}}, \underbrace{(n + 8964)! + 3}_{\text{is divided by 3}}, \dots, \underbrace{(n + 8964)! + (n + 1)}_{\text{is divided by } (n + 1)}$$

are n consecutive composite numbers. \square

Exercise 4.18.

Prove that the following two relations are equivalent:

(a)

$$\pi(x) = \frac{x}{\log x} + O\left(\frac{x}{\log^2 x}\right).$$

(b)

$$\vartheta(x) = x + O\left(\frac{x}{\log x}\right).$$

Proof.

(1) ((a) \implies (b)).

$$\begin{aligned} & \vartheta(x) \\ &= \pi(x) \log x - \int_2^x \frac{\pi(t)}{t} dt && \text{(Theorem 4.3)} \\ &= x + O\left(\frac{x}{\log x}\right) - \int_2^x \frac{dt}{\log t} + O\left(\int_2^x \frac{dt}{\log^2 t}\right) \\ &= x + O\left(\frac{x}{\log x}\right) + O\left(\frac{x}{\log x}\right) + O\left(\frac{x}{\log^2 x}\right) && \text{(Exercise 4.19(b))} \\ &= x + O\left(\frac{x}{\log x}\right). \end{aligned}$$

(2) ((b) \implies (a)).

$$\begin{aligned}
& \pi(x) \\
&= \frac{\vartheta(x)}{\log x} + \int_2^x \frac{\vartheta(t)}{t \log^2 t} dt && \text{(Theorem 4.3)} \\
&= \frac{x}{\log x} + O\left(\frac{x}{\log^2 x}\right) + \int_2^x \frac{dt}{\log^2 t} + O\left(\int_2^x \frac{dt}{\log^3 t}\right) \\
&= \frac{x}{\log x} + O\left(\frac{x}{\log^2 x}\right) + O\left(\frac{x}{\log^2 x}\right) + O\left(\frac{x}{\log^3 x}\right) && \text{(Exercise 4.19(b))} \\
&= \frac{x}{\log x} + O\left(\frac{x}{\log^2 x}\right).
\end{aligned}$$

□

Exercise 4.19. (Logarithmic integral)

If $x \geq 2$, let

$$\text{Li}(x) = \int_2^x \frac{dt}{\log t}$$

(the **logarithmic integral** of x).

(a) Prove that

$$\text{Li}(x) = \frac{x}{\log x} + \int_2^x \frac{dt}{\log^2 t} - \frac{2}{\log 2},$$

and that, more generally,

$$\text{Li}(x) = \frac{x}{\log x} \left(1 + \sum_{k=1}^{n-1} \frac{k!}{\log^k x} \right) + n! \int_2^x \frac{dt}{\log^{n+1} t} + C_n,$$

where C_n is independent of x .

(b) If $x \geq 2$ prove that

$$\int_2^x \frac{dt}{\log^n t} = O\left(\frac{x}{\log^n x}\right).$$

Proof of (a).

(1) Integration by parts gives

$$\text{Li}(x) = \frac{t}{\log t} \Big|_{t=2}^{t=x} + \int_2^x \frac{dt}{\log^2 t} = \frac{x}{\log x} + \int_2^x \frac{dt}{\log^2 t} - \frac{2}{\log 2}.$$

(2) We use induction to prove the general case. Suppose

$$\text{Li}(x) = \frac{x}{\log x} \left(1 + \sum_{k=1}^{n-1} \frac{k!}{\log^k x} \right) + n! \int_2^x \frac{dt}{\log^{n+1} t} + C_n$$

holds. Similar to part (1), we apply integration by parts to $\int_2^x \frac{dt}{\log^{n+1} t}$ to get

$$\begin{aligned} \int_2^x \frac{dt}{\log^{n+1} t} &= \frac{t}{\log^{n+1} t} \Big|_{t=2}^{t=x} + (n+1) \int_2^x \frac{dt}{\log^{n+2} t} \\ &= \frac{x}{\log^{n+1} x} + (n+1) \int_2^x \frac{dt}{\log^{n+2} t} - \frac{2}{\log^{n+1} 2}. \end{aligned}$$

Hence

$$\begin{aligned} \text{Li}(x) &= \frac{x}{\log x} \left(1 + \sum_{k=1}^{n-1} \frac{k!}{\log^k x} \right) \\ &\quad + n! \left(\frac{x}{\log^{n+1} x} + (n+1) \int_2^x \frac{dt}{\log^{n+2} t} - \frac{2}{\log^{n+1} 2} \right) + C_n \\ &= \frac{x}{\log x} \left(1 + \sum_{k=1}^n \frac{k!}{\log^k x} \right) + (n+1)! \int_2^x \frac{dt}{\log^{n+2} t} \\ &\quad + \underbrace{C_n - \frac{2 \cdot n!}{\log^{n+1} 2}}_{:=C_{n+1}}. \end{aligned}$$

By induction, the general case holds.

(3) Here

$$C_n = - \sum_{k=1}^n \frac{2 \cdot (k-1)!}{\log^k 2}$$

actually.

□

Proof of (b).

(1) Similar to the proof of Theorem 4.4.

$$\begin{aligned}
\int_2^x \frac{dt}{\log^n t} &= \int_2^{\sqrt{x}} \frac{dt}{\log^n t} + \int_{\sqrt{x}}^x \frac{dt}{\log^n t} \\
&\leq \frac{\sqrt{x}}{\log^n 2} + \frac{x - \sqrt{x}}{\log^n \sqrt{x}} \\
&\leq \frac{1}{\log^n 2} \cdot \sqrt{x} + 2^n \cdot \frac{x}{\log^n x} \\
&= O\left(\frac{x}{\log^n x}\right) + O\left(\frac{x}{\log^n x}\right) \quad \left(\lim_{x \rightarrow +\infty} \frac{\sqrt{x}}{\log^n x} = +\infty\right) \\
&= O\left(\frac{x}{\log^n x}\right)
\end{aligned}$$

if $x \geq \sqrt{x}$ or $x \geq 4$.

(2) We can apply L'Hospital's rule to give another proof.

□

Chapter 5: Congruences

Supplement. (Chinese remainder theorem)

(Exercise I.3.5 in the textbook: *Jürgen Neukirch, Algebraic Number Theory*.)
The quotient ring \mathcal{O}/\mathfrak{a} of a Dedekind domain by an ideal $\mathfrak{a} \neq 0$ is a principal ideal domain. (Hint: For $\mathfrak{a} = \mathfrak{p}^n$ the only proper ideals of \mathcal{O}/\mathfrak{a} are given by $\mathfrak{p}/\mathfrak{p}^n, \dots, \mathfrak{p}^{n-1}/\mathfrak{p}^n$. Choose $\pi \in \mathfrak{p} \setminus \mathfrak{p}^2$ and show that $\mathfrak{p}^\nu = \mathcal{O}\pi^\nu + \mathfrak{p}^n$.)

Proof.

- (1) By the Chinese remainder theorem, it suffices to show the case $\mathfrak{a} = \mathfrak{p}^n$ where \mathfrak{p} is prime.
- (2) There is a natural correspondence between

$$\{\text{ideals of } \mathcal{O}/\mathfrak{p}^n\} \longleftrightarrow \{\text{ideals of } \mathcal{O} \text{ containing } \mathfrak{p}^n\}.$$

Hence the proper ideals of $\mathcal{O}/\mathfrak{p}^n$ are given by $\mathfrak{p}/\mathfrak{p}^n, \dots, \mathfrak{p}^{n-1}/\mathfrak{p}^n$.

- (3) Similar to Exercise I.3.4, choose $\pi \in \mathfrak{p} \setminus \mathfrak{p}^2$ and thus $\mathfrak{p}^\nu = \mathcal{O}\pi^\nu + \mathfrak{p}^n$ ($\nu = 1, \dots, n-1$) since they have the same prime factorization. Hence $\mathfrak{p}^\nu/\mathfrak{p}^n = (\pi^\nu + \mathfrak{p}^n)$ is principal.

□

Chapter 6: Finite Abelian Groups and Their Characters

Supplement. (Serre, A Course in Arithmetic)

- (1) (Proposition VI.1) *Let H be a subgroup of a finite abelian group G . Every character of H extends to a character of G .*
- (2) (Proposition VI.2) *The group \widehat{G} is a finite abelian group of the same order of G .*
- (3) Worth the time and effort to read this book.

□

Supplement. (Serre, Linear Representations of Finite Groups)

- (1) (Proposition 2.5) The irreducible characters of a finite abelian G are denoted χ_1, \dots, χ_h ; their degrees are written n_1, \dots, n_h , we have $n_i = \chi_i(1)$. *The degrees n_i satisfy the relation $\sum_{i=1}^h n_i^2 = g$.*
- (2) (Exercise 2.3.1) *Show directly, using Schur's lemma, that each irreducible representation of an abelian group, finite or not, has degree 1. Proof.*
 - (a) (Schur's lemma) Let $\rho^1 : G \rightarrow \text{GL}(V_1)$ and $\rho^2 : G \rightarrow \text{GL}(V_2)$ be two irreducible representations of G , and let f be a linear mapping of V_1 into V_2 such that $\rho_s^2 \circ f = f \circ \rho_s^1$ for all $s \in G$. Then:
 - (i) If ρ^1 and ρ^2 are not isomorphic, we have $f = 0$.
 - (ii) If $V_1 = V_2$ and $\rho^1 = \rho^2$, f is a homothety (i.e., a scalar multiple of the identity).
 - (b) Let $\rho : G \rightarrow \text{GL}(V)$ be an irreducible representations of G . Since G is abelian,

$$\rho_s \circ \rho_t = \rho_t \circ \rho_s.$$

Schur's lemma implies that ρ_s is a homothety for any $s \in G$. Since ρ is irreducible, $\dim V$ cannot be strictly larger than 1.

□

- (3) (Proposition 2.7) *The number of irreducible representations of G (up to isomorphism) is equal to the number of classes of G .*
- (4) (1)(3) or (2)(3) implies Theorem 6.8. Again the book is good to read.

□

Exercise 6.1.

Let G be a set of n th roots of a nonzero complex number. If G is a group under multiplication, prove that G is the group of n th roots of unity.

Proof.

- (1) Write

$$G = \{z \in \mathbb{C} : z^n = w\}$$

where $w \in \mathbb{C}^\times$. It suffices to show that $w = 1$.

- (2) Since the multiplication is the binary operation on G , $z_1 \cdot z_2 \in G$ whenever $z_1, z_2 \in G$. Hence $w = (z_1 \cdot z_2)^n = (z_1)^n \cdot (z_2)^n = w \cdot w = w^2$ or $w = 1$. Note that G is nonempty and thus there exists an identity element of G .

□

Exercise 6.2.

Let G be a finite group of order n with identity element e . If a_1, \dots, a_n are n elements of G , not necessarily distinct, prove that there are integers p and q with $1 \leq p \leq q \leq n$ such that $a_p a_{p+1} \cdots a_q = e$.

Proof.

- (1) Consider the set

$$S = \{s_k := a_1 \cdots a_k : 1 \leq k \leq n\}.$$

- (2) There is nothing to do when $e \in S$ ($p = 1$).
- (3) Suppose $e \notin S$. The pigeonhole principle implies that there exists two distinct elements $s_p, s_q \in S$ such that $s_p = s_q$. Might assume $p < q$. Hence

$$\begin{aligned} s_p = s_q &\iff a_1 \cdots a_p = a_1 \cdots a_p a_{p+1} \cdots a_q \\ &\iff e = a_{p+1} \cdots a_q = s_p^{-1} s_q \end{aligned}$$

for some $1 \leq p < q \leq n$.

□

Exercise 6.3.

Let G be the set of all 2×2 matrices $\begin{pmatrix} a & b \\ c & d \end{pmatrix}$, where a, b, c, d are integers with $ad - bc = 1$. Prove that G is a group under matrix multiplication. This group is sometimes called the **modular group**.

Proof.

- (1) (Binary operation) Note that \mathbb{Z} is a ring and $\det(st) = \det(s)\det(t) = 1 \cdot 1 = 1$ whenever $s, t \in G$.
- (2) (Associativity) It is followed from the associativity of $M_2(\mathbb{C}) \supseteq G$.
- (3) (Identity element) $\begin{pmatrix} 1 & 0 \\ 0 & 1 \end{pmatrix}$ is the identity element of G .
- (4) (Inverse element) The inverse of $\begin{pmatrix} a & b \\ c & d \end{pmatrix} \in G$ is $\begin{pmatrix} d & -b \\ -c & a \end{pmatrix} \in G$.

□

Chapter 7: Dirichlet's Theorem on Primes in Arithmetic Progressions

Supplement.

Let $k > 0$ and $(h, k) = 1$. Let P be the set of primes numbers. Let P_h be the set of primes numbers such that $p \equiv h \pmod{k}$.

Theorem 7.3.

$$\sum_{\substack{p \leq x \\ p \in P_h}} \frac{\log p}{p} = \frac{1}{\varphi(k)} \log x + O(1)$$

for all $x > 1$.

We deal with the series $\sum p^{-1} \log p$ rather than $\sum p^{-1}$ to simplify the proof. Compare to the book *Serre, A Course in Arithmetic* for a classical proof of Dirichlet's Theorem:

$$\sum_{p \in P_h} \frac{1}{p^s} \sim \frac{1}{\varphi(k)} \log \frac{1}{s-1}.$$

for $s \rightarrow 1$.

Outline of the proof.

(1) Theorem 4.10 says that

$$\sum_{p \leq x} \frac{\log p}{p} = \log x + O(1).$$

Compare to Corollary 2 to Proposition VI.10 in *Serre, A Course in Arithmetic*:
When $s \rightarrow 1$, one has

$$\sum_p p^{-s} \sim \log \frac{1}{s-1}.$$

(2) By the orthogonality relation for Dirichlet characters,

$$\begin{aligned} \varphi(k) \sum_{\substack{p \leq x \\ p \in P_h}} \frac{\log p}{p} &= \overline{\chi_1}(h) \sum_{p \leq x} \frac{\chi_1(p) \log p}{p} + \sum_{r=2}^{\varphi(k)} \overline{\chi_r}(h) \sum_{p \leq x} \frac{\chi_r(p) \log p}{p} \\ &= \sum_{\substack{p \leq x \\ p \in P_k}} \frac{\log p}{p} + \sum_{r=2}^{\varphi(k)} \overline{\chi_r}(h) \sum_{p \leq x} \frac{\chi_r(p) \log p}{p}. \end{aligned}$$

Hence it suffices to consider $\sum_{\substack{p \leq x \\ p \in P_k}} \frac{\log p}{p}$ and $\sum_{p \leq x} \frac{\chi_r(p) \log p}{p}$. Compare to Lemma VI.9 in *Serre, A Course in Arithmetic*: Let

$$f_\chi(s) = \sum_{p \nmid k} \frac{\chi(p)}{p^s}.$$

Then

$$\sum_{p \in P_h} \frac{1}{p^s} = \frac{1}{\varphi(k)} \sum_{\chi} \chi(h)^{-1} f_\chi(s).$$

Again it suffices to consider two cases $\chi = 1$ and $\chi \neq 1$.

(3) Show that

$$\sum_{\substack{p \leq x \\ p \in P_k}} \frac{\log p}{p} = \sum_{p \leq x} \frac{\log p}{p} + O(1).$$

Compare to Lemma VI.7 in *Serre, A Course in Arithmetic*: If $\chi = 1$, then for $s \rightarrow 1$

$$f_\chi(s) \sim \log \frac{1}{s-1}.$$

(4) Show that

$$\sum_{p \leq x} \frac{\chi(p) \log p}{p} = O(1)$$

for each $\chi \neq \chi_1$. Compare to Lemma VI.8 in *Serre, A Course in Arithmetic*: If $\chi \neq 1$, $f_\chi(s)$ remains bounded when $s \rightarrow 1$.

(5) To prove part (4), consider the sum

$$\sum_{n \leq x} \frac{\chi(n) \Lambda(n)}{n}$$

and we write the sum as

$$\sum_{n \leq x} \frac{\chi(n) \Lambda(n)}{n} = \sum_{p \leq x} \frac{\chi(p) \log p}{p} + \underbrace{\sum_{p \leq x} \sum_{1 \leq a \leq \frac{\log x}{\log p}} \frac{\chi(p^a) \log p}{p^a}}_{=O(1)}.$$

Hence it suffices to show that $\sum_{n \leq x} \frac{\chi(n) \Lambda(n)}{n} = O(1)$. The proof is elementary and worth reading too. Compare to the proof of Lemma VI.8 in *Serre, A Course in Arithmetic*: we consider the L function

$$L(s, \chi) = \sum \frac{\chi(n)}{n^s} = \prod \frac{1}{1 - \frac{\chi(p)}{p^s}}$$

for $\operatorname{Re}(s) > 1$. Write

$$\underbrace{\log L(s, \chi)}_{=O(1)} = f_\chi(s) + \underbrace{\sum_{\substack{p \\ m \geq 2}} \frac{\chi(p)^m}{mp^{ms}}}_{=O(1)}$$

to get $f_\chi(s) = O(1)$. To prove $\log L(s, \chi) = O(1)$, we need some knowledge about complex analysis.
