Chapter 1: Rings and Ideals

Exercise 1.1.

Let x be a nilpotent element of A . Show that $1 + x$ is a unit of A . Deduce that the sum of a nilpotent element and a unit is a unit.

Proof.

- (1) Suppose $x^m = 0$ for some odd integer $m \geq 0$. Then

$$1 = 1 + x^m = (1 + x)(1 - x + x^2 - \cdots + (-1)^{m-1}x^{m-1}),$$

or $1 + x$ is a unit.

- (2) If u is any unit and x is any nilpotent, $u + x = u \cdot (1 + u^{-1}x)$ is a product of two units (using that $u^{-1}x$ is nilpotent and applying (1)) and hence a unit again.

□

Proof (Proposition 1.9).

- (1) *The nilradical is a subset of the Jacobson radical.*
- (a) The nilradical \mathfrak{N} of A is the intersection of all the prime ideals of A by Proposition 1.8.
 - (b) The Jacobson radical \mathfrak{J} of A is the intersection of all the maximal ideals of A by definition.
- (2) By Proposition 1.9, $x \in \mathfrak{J}$ if and only if $1 - xy$ is a unit in A for all $y \in A$. So $1 + x = 1 - (-x) \cdot 1$ is a unit in A since x is a nilpotent and \mathfrak{J} is an ideal.

□

Exercise 1.2.

Let A be a ring and let $A[x]$ be the ring of polynomials in an indeterminate x , with coefficients in A . Let $f = a_0 + a_1x + \cdots + a_nx^n \in A[x]$. Prove that

- (i) f is a unit in $A[x]$ if and only if a_0 is a unit in A and a_1, \dots, a_n are nilpotent. (Hint: If $b_0 + b_1x + \cdots + b_mx^m$ is the inverse of f , prove by induction on r that $a_n^{r+1}b_{m-r} = 0$. Hence show that a_n is nilpotent, and then use Exercise 1.1.)
- (ii) f is nilpotent if and only if a_0, a_1, \dots, a_n are nilpotent.

- (iii) f is a zero-divisor if and only if there exists $a \neq 0$ such that $af = 0$. (Hint: Choose a polynomial $g = b_0 + b_1x + \cdots + b_mx^m$ of least degree m such that $fg = 0$. Then $a_nb_m = 0$, hence $a_ng = 0$ (because a_ng annihilates f and has degree $< m$). Now show by induction that $a_{n-r}g = 0$ ($0 \leq r \leq n$).)
- (iv) f is said to be primitive if $(a_0, a_1, \dots, a_n) = (1)$. Prove that if $f, g \in A[x]$, then fg is primitive if and only if f and g are primitive.

Proof of (i).

- (1) (\Leftarrow) holds by Exercise 1.1.
- (2) (\Rightarrow) There exists the inverse g of f , say $g = b_0 + b_1x + \cdots + b_mx^m$ satisfying $1 = fg$. Clearly, $1 = a_0b_0$, or a_0 is a unit in A . Also,

$$\begin{aligned} 0 &= a_nb_m, \\ 0 &= a_nb_{m-1} + a_{n-1}b_m, \\ 0 &= a_nb_{m-2} + a_{n-1}b_{m-1} + a_{n-2}b_m, \\ &\dots \end{aligned}$$

A direct computing shows that

$$\begin{aligned} 0 &= a_n^1b_m, \\ 0 &= a_n(a_nb_{m-1} + a_{n-1}b_m) \\ &= a_n^2b_{m-1} + a_{n-1}a_nb_m \\ &= a_n^2b_{m-1}, \\ 0 &= a_n^2(a_nb_{m-2} + a_{n-1}b_{m-1} + a_{n-2}b_m) \\ &= a_n^3b_{m-2} + a_{n-1}a_n^2b_{m-1} + a_{n-2}a_n^2b_m \\ &= a_n^3b_{m-2}, \\ &\dots \end{aligned}$$

So we might have $a_n^{r+1}b_{m-r} = 0$ for $r = 0, 1, 2, \dots, m$.

- (3) Show that $a_n^{r+1}b_{m-r} = 0$ for $r = 0, 1, 2, \dots, m$ by induction on r .
- (a) As $r = 0$, $a_nb_m = 0$ by comparing the coefficient of $fg = 1$ at x^{n+m} .
- (b) For any $r > 0$, comparing the coefficient of $fg = 1$ at x^{n+m-r} ,

$$0 = a_nb_{m-r} + a_{n-1}b_{m-r+1} + \cdots + a_{n-r}b_m.$$

Multiplying by a_n^r on the both sides,

$$\begin{aligned} 0 &= a_n^{r+1}b_{m-r} + a_{n-1}a_n^rb_{m-r+1} + \cdots + a_{n-r}a_n^rb_m \\ &= a_n^{r+1}b_{m-r}. \end{aligned}$$

by the induction hypothesis.

- (4) a_n is a nilpotent. Putting $r = m$ in $a_n^{r+1}b_{m-r} = 0$ and get $a_n^{m+1}b_0 = 0$. Notice that b_0 is a unit, $a_n^{m+1} = 0$, or a_n is a nilpotent.
- (5) Consider $f - a_n x^n = a_0 + a_1 x + \cdots + a_{n-1} x^{n-1}$, a polynomial $\in A[x]$ of degree $n-1$. Note that f is a unit and $a_n x^n$ is a nilpotent. By Exercise 1.1, $f - a_n x^n$ is a unit too. Applying the (2)(3)(4) again, a_{n-1} is a nilpotent as $n-1 > 0$, that is, applying descending induction on n then yields the desired property.

□

Proof of (ii).

- (1) (\Leftarrow) holds since the nilradical of any ring is an ideal.
- (2) (\Rightarrow) $f^N = 0$ for some $N > 0$. So $0 = f^N = a_n^N x^{nN} + \cdots + a_0^N$. Comparing the coefficient in the leading term x^{nN} leads to $a_n^N = 0$, or a_n is a nilpotent.
- (3) Consider $f - a_n x^n = a_0 + a_1 x + \cdots + a_{n-1} x^{n-1}$, a polynomial $\in A[x]$ of degree $n-1$. Note that f and $a_n x^n$ are nilpotent. $f - a_n x^n$ is a nilpotent too. Similar to step (5) in the proof of (i), applying descending induction on n then yields the desired property.

□

Proof of (iii).

- (1) (\Leftarrow) holds trivially.
- (2) (\Rightarrow) Pick a polynomial $g = b_0 + b_1 x + \cdots + b_m x^m$ of least degree m such that $fg = 0$. Especially, $a_n b_m = 0$.
- (3) Consider

$$\begin{aligned} a_n g &= a_n b_0 + \cdots + a_n b_{m-1} x^{m-1} + a_n b_m x^m \\ &= a_n b_0 + \cdots + a_n b_{m-1} x^{m-1} \end{aligned}$$

(since $a_n b_m = 0$). $a_n g$ is a polynomial over A of having degree strictly less than m . Notice that $f \cdot (a_n g) = a_n \cdot (fg) = 0$. By minimality of m , $a_n g = 0$.

- (4) Induction on the degree n of f .
- (a) As $n = 0$, $f = a_0$. There exists $b_m \neq 0$ such that $b_m f = b_m a_0 = 0$ by (2).
- (b) For any zero-divisor f of degree n , there is a polynomial $g = b_0 + b_1 x + \cdots + b_m x^m$ of least degree m such that $fg = 0$. By (2)(3),

$$\begin{aligned} (f - a_n x^n) \cdot g &= fg - a_n x^n g \\ &= 0 - 0 \\ &= 0. \end{aligned}$$

That is, $f - a_n x^n$ is a zero-divisor of degree $n - 1$. By the induction hypothesis, there exists $b_m \neq 0$ such that $b_m(f - a_n x^n) = 0$. So $b_m f = b_m(f - a_n x^n) + b_m a_n x^n = 0 + 0 = 0$.

(c) By (a)(b), (\implies) holds by mathematical induction.

□

Proof of (iv). Note that

- (1) $f \notin \mathfrak{m}[x]$ for any maximal ideal \mathfrak{m} of A if and only if f is primitive.
- (2) For any maximal ideal \mathfrak{m} of A , A/\mathfrak{m} is a field (or an integral domain).
- (3) $A[x]$ is an integral domain if A is an integral domain.
- (4) $A[x]/\mathfrak{m}[x] \cong (A/\mathfrak{m})[x]$ as a ring isomorphism.

Hence,

$$\begin{aligned}
 f, g : \text{primitive} &\iff f, g \notin \mathfrak{m}[x] \text{ for any maximal ideal } \mathfrak{m} \\
 &\iff f, g \neq 0 \text{ in } (A/\mathfrak{m})[x] \text{ for any maximal ideal } \mathfrak{m} \\
 &\iff fg \neq 0 \text{ in } (A/\mathfrak{m})[x] \text{ for any maximal ideal } \mathfrak{m} \\
 &\iff fg \notin \mathfrak{m}[x] \text{ for any maximal ideal } \mathfrak{m} \\
 &\iff fg : \text{primitive}.
 \end{aligned}$$

□

Exercise 1.3.

Generalize the results of Exercise 1.2 to a polynomial ring $A[x_1, \dots, x_r]$ in several indeterminates.

Generalization. Let

$$f = \sum_{(i)} a_{(i)} x^{(i)} \in A[x_1, \dots, x_r]$$

where $\sum_{(i)}$ is the summation over $(i) = (i_1, \dots, i_r)$ with $i_1 + \dots + i_r = n$. Then

- (i) f is a unit in $A[x_1, \dots, x_r]$ if and only if $a_{(0)}$ is a unit in A and all other $a_{(i)}$ are nilpotent.
- (ii) f is nilpotent if and only if all $a_{(i)}$ are nilpotent.
- (iii) f is a zero-divisor if and only if there exists $a \neq 0$ such that $af = 0$.
- (iv) If $f, g \in A[x_1, \dots, x_r]$, then fg is primitive if and only if f and g are primitive.

Proof. Use the mathematical induction to prove (i)(ii)(iii) and apply the exactly the same argument in Exercise 1.2 (iv) to prove (iv). \square

Exercise 1.4.

In the ring $A[x]$, the Jacobson radical is equal to the nilradical.

Proof.

- (1) The nilradical \mathfrak{N} is a subset of the Jacobson radical \mathfrak{J} . It suffices to show that $\mathfrak{J} \subseteq \mathfrak{N}$.

- (2)

$$\begin{aligned}
 & f \in \mathfrak{J} \\
 \iff & 1 - fy \text{ is a unit in } A[x] \text{ for all } y \in A[x] && \text{(Proposition 1.9)} \\
 \implies & 1 - xf \text{ is a unit in } A[x] && (y = x) \\
 \implies & \text{All coefficients of } f \text{ are nilpotent} && \text{(Exercise 1.2 (i))} \\
 \implies & f \text{ is nilpotent} && \text{(Exercise 1.2 (ii))} \\
 \implies & f \in \mathfrak{N}.
 \end{aligned}$$

\square

Exercise 1.7.

Let A be a ring in which every element satisfies $x^n = x$ for some $n > 1$ (depending on x). Show that every prime ideal in A is maximal.

Proof. It suffices to show that for any prime ideal \mathfrak{p} in A , A/\mathfrak{p} is a field.

- (1) Take any $0 \neq \bar{x} \in A/\mathfrak{p}$, which is represented by $x \in A - \mathfrak{p}$. By assumption there exists $n \geq 2$ such that $x^n = x$. So $\bar{x}^n = \bar{x}$ or $\bar{x}(\bar{x}^{n-1} - 1) = 0$.
- (2) Since \mathfrak{p} is prime, A/\mathfrak{p} is a integral domain. That is, $\bar{x} = 0$ (impossible) or $\bar{x}^{n-1} - 1 = 0$. Write $\bar{x} \cdot \bar{x}^{n-2} = 1$ in A/\mathfrak{p} . So \bar{x}^{n-2} is an inverse of $\bar{x} \neq 0$ in A/\mathfrak{p} , which implies that A/\mathfrak{p} is a field (since \bar{x} is arbitrary).
- (3) A/\mathfrak{p} is a field if and only if \mathfrak{p} is maximal.

\square

Exercise 1.8.

Let A be a ring $\neq 0$. Show that the set of prime ideals of A has minimal elements with respect to inclusion.

Similar to Theorem 1.3.

Proof (Zorn's Lemma).

- (1) Let Σ be the set of all prime ideals of A .
- (2) Order Σ by \supseteq , that is, $\mathfrak{p} \leq \mathfrak{q}$ if $\mathfrak{p} \supseteq \mathfrak{q}$.
- (3) Σ is not empty, since every ring $A \neq 0$ has at least one maximal ideal (or prime ideal) (Theorem 1.3).
- (4) To apply Zorn's lemma we must show that every chain in Σ has a lower bound in Σ ; let then (\mathfrak{p}_α) be a chain of prime ideals in Σ , so that for each pair of indices α, β we have either $\mathfrak{p}_\alpha \subseteq \mathfrak{p}_\beta$ or $\mathfrak{p}_\beta \subseteq \mathfrak{p}_\alpha$. Let $\mathfrak{p} = \bigcap_\alpha \mathfrak{p}_\alpha$.
- (5) Show that \mathfrak{p} is a prime ideal. Clearly \mathfrak{p} is an ideal. Given any $xy \in \mathfrak{p}$ and $x \notin \mathfrak{p}$. So xy is in all prime ideals \mathfrak{p}_α . By assumption $x \notin \mathfrak{p}$, there is some β such that $x \notin \mathfrak{p}_\beta$, or $x \notin \mathfrak{p}_\alpha$ whenever $\alpha \geq \beta$. So $y \in \mathfrak{p}_\alpha$ whenever $\alpha \geq \beta$. Since $y \in \mathfrak{p}_\beta$, $y \in \mathfrak{p}_\gamma$ whenever $\beta \geq \gamma$. Therefore, $y \in \mathfrak{p}_\alpha$ for all α , or $y \in \mathfrak{p}$, or \mathfrak{p} is prime.

□

Exercise 1.9.

Let \mathfrak{a} be an ideal $\neq (1)$ in a ring A . Show that $\mathfrak{a} = r(\mathfrak{a}) \iff \mathfrak{a}$ is an intersection of prime ideals.

Proof.

- (1) (\implies) . By Proposition 1.14, $\mathfrak{a} = r(\mathfrak{a})$ is the intersection of the prime ideals which contain \mathfrak{a} .
- (2) (\impliedby) .

$$\begin{aligned}
 \mathfrak{a} &= \bigcap \{\mathfrak{p} \in \text{some subset of } \text{Spec}(A)\} \\
 &= \bigcap \{\mathfrak{p} \in \text{some subset of } \text{Spec}(A) : \mathfrak{p} \supseteq \mathfrak{a}\} \\
 &\supseteq \bigcap \{\mathfrak{p} \in \text{Spec}(A) : \mathfrak{p} \supseteq \mathfrak{a}\} \\
 &= r(\mathfrak{a}) \\
 &\supseteq \mathfrak{a}.
 \end{aligned}$$

□

The prime spectrum of a ring

Exercise 1.15.

Let A be a ring and let X be the set of all prime ideals of A . For each subset E of A , let $V(E)$ denote the set of all prime ideals of A which contain E . Prove that

- (i) if \mathfrak{a} is the ideal generated by E , then $V(E) = V(\mathfrak{a}) = V(r(\mathfrak{a}))$.
- (ii) $V(0) = X$, $V(1) = \emptyset$.
- (iii) if $(E_i)_{i \in I}$ is any family of subsets of A , then

$$V\left(\bigcup_{i \in I} E_i\right) = \bigcap_{i \in I} V(E_i).$$

- (iv) $V(\mathfrak{a} \cap \mathfrak{b}) = V(\mathfrak{a}\mathfrak{b}) = V(\mathfrak{a}) \cup V(\mathfrak{b})$ for any ideals $\mathfrak{a}, \mathfrak{b}$ of A .

The results show that the sets $V(E)$ satisfy the axioms for closed sets in a topological space. The resulting topology is called the Zariski topology. The topological space X is called the prime spectrum of A , and is written $\text{Spec}(A)$.

Note that if $E_1 \subseteq E_2$, then $V(E_1) \supseteq V(E_2)$.

Proof of (i).

- (1) Show that $V(E) = V(\mathfrak{a})$.

- (a) Show that $V(E) \subseteq V(\mathfrak{a})$. Given any $\mathfrak{p} \in V(E)$, $\mathfrak{p} \supseteq E$. For any $a \in \mathfrak{a}$, since \mathfrak{a} is generated by E , we can write a as a finite sum $a = \sum \alpha\beta$ where $\alpha \in A$ and $\beta \in E$. Since $E \subseteq \mathfrak{p}$, all $\beta \in \mathfrak{p}$. Since \mathfrak{p} is an ideal, $a = \sum \alpha\beta \in \mathfrak{p}$. That is, $\mathfrak{p} \supseteq \mathfrak{a}$, or $\mathfrak{p} \in V(\mathfrak{a})$.
- (b) $V(E) \supseteq V(\mathfrak{a})$ since $\mathfrak{a} \supseteq E$.

- (2) Show that $V(\mathfrak{a}) = V(r(\mathfrak{a}))$.

- (a) Show that $V(\mathfrak{a}) \subseteq V(r(\mathfrak{a}))$. Given any $\mathfrak{p} \in V(\mathfrak{a})$,

$$\begin{aligned} \mathfrak{p} \in V(\mathfrak{a}) &\implies \mathfrak{p} \supseteq \mathfrak{a} \\ &\implies \mathfrak{p} \supseteq \text{the intersection of the prime ideals } \mathfrak{p} \supseteq \mathfrak{a} \\ &\implies \mathfrak{p} \supseteq r(\mathfrak{a}) \text{ (by Proposition 1.14)} \\ &\implies \mathfrak{p} \in V(r(\mathfrak{a})). \end{aligned}$$

(b) $V(\mathfrak{a}) \supseteq V(r(\mathfrak{a}))$ since $r(\mathfrak{a}) \supseteq \mathfrak{a}$.

□

Proof of (ii).

(1) $V(1) = \emptyset$ since no prime ideal contains 1 by definition.

(2) $V(0) = X$ since 0 is in every ideal (especially in every prime ideal).

□

Proof of (iii).

$$\begin{aligned} \mathfrak{p} \in V\left(\bigcup_{i \in I} E_i\right) &\iff \mathfrak{p} \supseteq \bigcup_{i \in I} E_i \\ &\iff \mathfrak{p} \supseteq E_i \text{ for all } i \in I \\ &\iff \mathfrak{p} \in V(E_i) \text{ for all } i \in I \\ &\iff \mathfrak{p} \in \bigcap_{i \in I} V(E_i). \end{aligned}$$

□

Lemma. For any $\mathfrak{p} \supseteq \mathfrak{a}\mathfrak{b}$, $\mathfrak{p} \supseteq \mathfrak{a}$ or $\mathfrak{p} \supseteq \mathfrak{b}$.

Proof of Lemma.

(1) If $\mathfrak{p} \supseteq \mathfrak{a}$. We are done.

(2) If $\mathfrak{p} \not\supseteq \mathfrak{a}$, there exists $a \in \mathfrak{a} - \mathfrak{p}$. So for any $b \in \mathfrak{b}$, $b \in \mathfrak{p}$ since $ab \in \mathfrak{a}\mathfrak{b} \subseteq \mathfrak{p}$ and \mathfrak{p} is a prime ideal, that is, $\mathfrak{p} \supseteq \mathfrak{b}$.

By (1)(2), $\mathfrak{p} \supseteq \mathfrak{a}$ or $\mathfrak{p} \supseteq \mathfrak{b}$. □

Proof of (iv).

(1) Show that $V(\mathfrak{a} \cap \mathfrak{b}) = V(\mathfrak{a}\mathfrak{b})$.

(a) $V(\mathfrak{a} \cap \mathfrak{b}) \subseteq V(\mathfrak{a}\mathfrak{b})$ since $\mathfrak{a}\mathfrak{b} \subseteq \mathfrak{a} \cap \mathfrak{b}$.

(b) Show that $V(\mathfrak{a} \cap \mathfrak{b}) \supseteq V(\mathfrak{a}\mathfrak{b})$. Given any $\mathfrak{p} \in V(\mathfrak{a}\mathfrak{b})$, $\mathfrak{p} \supseteq \mathfrak{a}\mathfrak{b}$. By Lemma, $\mathfrak{p} \supseteq \mathfrak{a}$ or $\mathfrak{p} \supseteq \mathfrak{b}$. Notice that $\mathfrak{a} \supseteq \mathfrak{a} \cap \mathfrak{b}$ and $\mathfrak{b} \supseteq \mathfrak{a} \cap \mathfrak{b}$. In any case, $\mathfrak{p} \supseteq \mathfrak{a} \cap \mathfrak{b}$, $\mathfrak{p} \in V(\mathfrak{a} \cap \mathfrak{b})$.

(2) Show that $V(\mathfrak{a}\mathfrak{b}) = V(\mathfrak{a}) \cup V(\mathfrak{b})$.

(a) Show that $V(\mathfrak{a}\mathfrak{b}) \subseteq V(\mathfrak{a}) \cup V(\mathfrak{b})$. Given any $\mathfrak{p} \in V(\mathfrak{a}\mathfrak{b})$, $\mathfrak{p} \supseteq \mathfrak{a}\mathfrak{b}$. By Lemma, $\mathfrak{p} \supseteq \mathfrak{a}$ or $\mathfrak{p} \supseteq \mathfrak{b}$, $\mathfrak{p} \in V(\mathfrak{a})$ or $\mathfrak{p} \in V(\mathfrak{b})$, $\mathfrak{p} \in V(\mathfrak{a}) \cup V(\mathfrak{b})$.

- (b) Show that $V(\mathfrak{a}\mathfrak{b}) \supseteq V(\mathfrak{a}) \cup V(\mathfrak{b})$. Given any $\mathfrak{p} \in V(\mathfrak{a}) \cup V(\mathfrak{b})$, $\mathfrak{p} \in V(\mathfrak{a})$ or $\mathfrak{p} \in V(\mathfrak{b})$, $\mathfrak{p} \supseteq \mathfrak{a}$ or $\mathfrak{p} \supseteq \mathfrak{b}$. Notice that $\mathfrak{a} \supseteq \mathfrak{a}\mathfrak{b}$ and $\mathfrak{b} \supseteq \mathfrak{a}\mathfrak{b}$. In any cases, $\mathfrak{p} \supseteq \mathfrak{a}\mathfrak{b}$, or $\mathfrak{p} \in V(\mathfrak{a}\mathfrak{b})$.

□

Exercise 1.17.

For each $f \in A$, let X_f denote the complement of $V(f)$ in $X = \text{Spec}(A)$. The sets X_f are open. Show that they form a basis of open sets for the Zariski topology, and that

- (i) $X_f \cap X_g = X_{fg}$.
- (ii) $X_f = \emptyset \iff f$ is nilpotent.
- (iii) $X_f = X \iff f$ is a unit.
- (iv) $X_f = X_g \iff r((f)) = r((g))$.
- (v) X is quasi-compact (compact), that is, every open covering of X has a finite subcovering.
- (vi) More generally, each X_f is quasi-compact.
- (vii) An open subset of X is quasi-compact if and only if it is a finite union of sets X_f .

The sets X_f are called basic open sets of $X = \text{Spec}(A)$.

(Hint: To prove (v), remark that it is enough to consider a covering of X by basic open sets X_{f_i} ($i \in I$). Show that the f_i generate the unit ideal and hence that there is an equation of the form

$$1 = \sum_{i \in J} g_i f_i \quad (g_i \in A)$$

where J is some finite subset of I . Then the X_{f_i} ($i \in J$) cover X .)

Proof of basis. It is equivalent to Exercise 1.15 (iii). Given any open set O in X . Write $O = X - V(\mathfrak{a})$ for some ideal \mathfrak{a} of A . Since

$$V(\mathfrak{a}) = V\left(\bigcup_{f \in \mathfrak{a}} (f)\right) = \bigcap_{f \in \mathfrak{a}} V(f),$$

we have

$$O = X - V(\mathfrak{a}) = X - \bigcap_{f \in \mathfrak{a}} V(f) = \bigcup_{f \in \mathfrak{a}} (X - V(f)) = \bigcup_{f \in \mathfrak{a}} X_f,$$

or any open set is a union of basic open sets. \square

Proof of (i). $X_f \cap X_g = X_{fg} \iff V(f) \cup V(g) = V(fg)$ holds by Exercise 1.15 (iv). \square

Proof of (ii).

$$\begin{aligned} X_f = \emptyset &\iff V(f) = X \\ &\iff f \in \mathfrak{p} \text{ for all prime ideal } \mathfrak{p} \text{ of } A \\ &\iff f \in \mathfrak{N}, \text{ the nilradical of } A \text{ (Proposition 1.8)} \\ &\iff f \text{ is nilpotent (Proposition 1.7)} \end{aligned}$$

\square

Proof of (ii)(Using (iv)).

$$\begin{aligned} X_f = \emptyset &\iff X_f = X_0 && \text{(Exercise 15(ii))} \\ &\iff r(f) = r(0) && \text{((iv))} \\ &\iff f \in r(f) = r(0) \\ &\iff f^m = 0 \text{ for some } m > 0 \\ &\iff f \text{ is nilpotent} \end{aligned}$$

\square

Proof of (iii).

$$\begin{aligned} X_f = X &\iff V(f) = \emptyset \\ &\iff f \notin \mathfrak{p} \text{ for all prime ideal } \mathfrak{p} \text{ of } A \\ &\iff f \text{ is unit (Corollary 1.5)} \end{aligned}$$

\square

Proof of (iii)(Using (iv)).

$$\begin{aligned} X_f = X &\iff X_f = X_1 && \text{(Exercise 15(ii))} \\ &\iff r(f) = r(1) && \text{((iv))} \\ &\iff f \in r(f) = r(1) \\ &\iff f^m = 1 \text{ for some } m > 0 \\ &\iff f \text{ is unit} \end{aligned}$$

\square

Proof of (iv).

(1) Show that $X_f \subseteq X_g \iff r((f)) \subseteq r((g))$. Actually,

$$\begin{aligned}
X_f \subseteq X_g &\implies V(f) \supseteq V(g) \\
&\implies \{\mathfrak{p} \in \text{Spec}(A) : \mathfrak{p} \supseteq (f)\} \supseteq \{\mathfrak{p} \in \text{Spec}(A) : \mathfrak{p} \supseteq (g)\} \\
&\implies \bigcap_{(f) \subseteq \mathfrak{p} \in \text{Spec}(A)} \mathfrak{p} \subseteq \bigcap_{(g) \subseteq \mathfrak{p} \in \text{Spec}(A)} \mathfrak{p} \\
&\stackrel{1.14}{\implies} r(f) \subseteq r(g) \\
&\implies V(r(f)) \supseteq V(r(g)) \\
&\implies V(f) \supseteq V(g) \\
&\implies X_f \subseteq X_g.
\end{aligned}$$

(2) By (1),

$$\begin{aligned}
X_f \subseteq X_g &\iff r((f)) \subseteq r((g)), \\
X_f \supseteq X_g &\iff r((f)) \supseteq r((g)).
\end{aligned}$$

Hence,

$$X_f = X_g \iff r((f)) = r((g)).$$

□

Proof of (v). Notice that it is enough to consider a covering of X by basic open sets X_{f_i} ($i \in I$).

(1) Since X is covered by X_{f_i} ($i \in I$),

$$\begin{aligned}
X = \bigcup_{i \in I} X_{f_i} &\implies X - V(1) = \bigcup_{i \in I} (X - V(f_i)) \\
&\implies V(1) = \bigcap_{i \in I} V(f_i) \\
&\implies V(1) = V\left(\sum_{i \in I} f_i\right) \\
&\implies r(1) = r\left(\sum_{i \in I} f_i\right).
\end{aligned}$$

Hence, $1 \in r(1) = r\left(\sum_{i \in I} f_i\right)$ can be expressed as

$$1 = 1^m = \sum_{j \in J} g_j f_j$$

where J is a finite subset of I and $g_j \in A$. That is, $(1) = \sum_{j \in J} f_j$.

(2) Hence, $V(1) = V\left(\sum_{j \in J} f_j\right)$. Therefore, X is covered by finite subcovering $\{X_{f_j}\} (j \in J)$.

□

Proof of (v)(Using (vi)). Since $X = X_1$, X is quasi-compact by (vi). □

Proof of (vi). Notice that it is enough to consider a covering of X_f by basic open sets X_{f_i} ($i \in I$).

(1) Since X_f is covered by X_{f_i} ($i \in I$),

$$\begin{aligned} X_f = \bigcup_{i \in I} X_{f_i} &\implies X - V(f) = \bigcup_{i \in I} (X - V(f_i)) \\ &\implies V(f) = \bigcap_{i \in I} V(f_i) \\ &\implies V(f) = V\left(\sum_{i \in I} f_i\right) \\ &\implies r(f) = r\left(\sum_{i \in I} f_i\right). \end{aligned}$$

Hence, $f \in r(f) = r\left(\sum_{i \in I} f_i\right)$ can be expressed as

$$f^m = \sum_{j \in J} g_j f_j$$

where J is a finite subset of I and $g_j \in A$. That is, $f^m \in \sum_{j \in J} f_j$.

(2) Show that $V\left(\sum_{j \in J} f_j\right) = V(f)$.

(a) (\subseteq) For any prime ideal $\mathfrak{p} \supseteq \sum_{j \in J} f_j$, $f^m \in \mathfrak{p}$ or $f \in \mathfrak{p}$ (since \mathfrak{p} is prime). So $\mathfrak{p} \supseteq (f)$, or $V\left(\sum_{j \in J} f_j\right) \subseteq V(f)$.

(b) (\supseteq)

$$\sum_{j \in J} f_j \subseteq \sum_{i \in I} f_i \implies V\left(\sum_{j \in J} f_j\right) \supseteq V\left(\sum_{i \in I} f_i\right) = V(f).$$

(3) Therefore, X_f is covered by finite subcovering $\{X_{f_j}\}(j \in J)$.

□

Proof of (vi)(Using (v)). Exercise 3.21 (i) shows that X_f is the spectrum of A_f . By (v), X_f is quasi-compact. □

Proof of (vii).

- (1) (\implies) Given an open subset O . Since X_f form a basis of open sets,

$$O = \bigcup_{f \in \mathfrak{a}} X_f \text{ for some ideal } \mathfrak{a} \text{ of } A$$

Especially, $\{X_f\}_{f \in \mathfrak{a}}$ is an open covering of O . Since O is quasi-compact, there exists a finite subcovering $\{X_f\}_{f \in J}$ of O , where J is a finite subset of \mathfrak{a} (as a set). That is, $O = \bigcup_{f \in J} X_f$ is a finite union of sets X_f .

- (2) (\impliedby) Since X_f is quasi-compact, any finite union of quasi-compact sets is quasi-compact again.

□

Exercise 1.19.

A topological space X is said to be irreducible if $X \neq \emptyset$ and if every pair of non-empty open sets in X intersect, or equivalently if every non-empty open set is dense in X . Show that $\text{Spec}(A)$ is irreducible if and only if the nilradical of A is a prime ideal.

Proof. Use the notations in Proposition 1.7 and Exercise 1.17.

$\text{Spec}(A)$ is irreducible

$$\iff X_f \cap X_g \neq \emptyset \text{ for any nonempty } X_f, X_g \in \text{Spec}(A)$$

$$\iff X_{fg} \neq \emptyset \text{ for any nonempty } X_f, X_g \in \text{Spec}(A) \quad (\text{Exercise 1.17 (i)})$$

$$\iff fg \notin \mathfrak{N} \text{ for any } f, g \notin \mathfrak{N} \quad (\text{Exercise 1.17 (ii)})$$

$$\iff \mathfrak{N} \text{ is prime.}$$

□

Exercise 1.20.

Let X be a topological space.

- (i) If Y is an irreducible subspace of X , then the closure \overline{Y} of Y in X is irreducible.

Proof of (i).

- (1) Y is irreducible if and only if Y cannot be represented as the union of two

proper closed subspaces.

$$\begin{aligned}
& \forall \text{ nonempty open sets } U_1 \text{ and } U_2, U_1 \cap U_2 \neq \emptyset \\
& \iff \forall \text{ nonempty open sets } U_1 \text{ and } U_2, X - (U_1 \cap U_2) \neq X \\
& \iff \forall \text{ nonempty open sets } U_1 \text{ and } U_2, (X - U_1) \cup (X - U_2) \neq X \\
& \iff \forall \text{ proper closed sets } Y_1 \text{ and } Y_2, Y_1 \cup Y_2 \neq X \\
& \iff \nexists \text{ proper closed sets } Y_1 \text{ and } Y_2, Y_1 \cup Y_2 = X.
\end{aligned}$$

(2) If \overline{Y} were reducible, there are two closed set Y_1 and Y_2 such that

$$\overline{Y} \subseteq Y_1 \cup Y_2, \overline{Y} \not\subseteq Y_i (i = 1, 2).$$

- (a) $Y \subseteq \overline{Y} \subseteq Y_1 \cup Y_2$.
- (b) $Y \not\subseteq Y_i (i = 1, 2)$. If not, $Y \subseteq Y_i$ for some i . Take closure to get $\overline{Y} \subseteq \overline{Y_i} = Y_i$ (since Y_i is closed), contrary to the assumption.

By (a)(b), Y is reducible, which is absurd.

□

Supplement 1.20.1.

(Exercise I.1.6 in Robin Hartshorne, *Algebraic Geometry*.) Any nonempty open subset of an irreducible topological space is dense and irreducible. If Y is a subset of a topological space X , which is irreducible in its induced topology, then the closure \overline{Y} is also irreducible.

Here we use the definition of irreducibility given by Hartshorne.

Definition. A nonempty subset Y of a topological space X is irreducible if it cannot be expressed as the union $Y = Y_1 \cup Y_2$ of two proper subsets, each one of which is closed in Y . The empty set is not considered to be irreducible.

The proof is the same as Exercise 1.20(i) except that any nonempty open subset of an irreducible topological space is irreducible.

Proof (Irreducibility of open subsets). Given any open subset U of an irreducible topological space X . Write $U \subseteq Y_1 \cup Y_2$ where Y_1 and Y_2 are closed in X .

$$\begin{aligned}
U \subseteq Y_1 \cup Y_2 & \implies \overline{U} \subseteq \overline{Y_1 \cup Y_2} \\
& \implies X \subseteq Y_1 \cup Y_2 & (U \text{ is dense, } Y_1 \cup Y_2 \text{ is closed}) \\
& \implies Y_1 = X \supseteq U \text{ or } Y_2 = X \supseteq U & (X \text{ is irreducible}) \\
& \implies U \text{ is irreducible.}
\end{aligned}$$

□

Chapter 2: Modules

Exercise 2.1.

Show that $(\mathbb{Z}/m\mathbb{Z}) \otimes_{\mathbb{Z}} (\mathbb{Z}/n\mathbb{Z}) = 0$ if m, n are coprime.

It suffices to show that

$$(\mathbb{Z}/m\mathbb{Z}) \otimes_{\mathbb{Z}} (\mathbb{Z}/n\mathbb{Z}) \cong \mathbb{Z}/d\mathbb{Z}$$

where d is the greatest common divisor of m and n .

Outlines.

- (1) Define $\tilde{\varphi}$ by

$$\begin{array}{ccc} \tilde{\varphi}: & (\mathbb{Z}/m\mathbb{Z}) \times (\mathbb{Z}/n\mathbb{Z}) & \longrightarrow \mathbb{Z}/d\mathbb{Z} \\ & \Downarrow & \Downarrow \\ & (x + m\mathbb{Z}, y + n\mathbb{Z}) & \longmapsto xy + d\mathbb{Z}. \end{array}$$

$\tilde{\varphi}$ is well-defined and \mathbb{Z} -bilinear.

- (2) By the universal property, $\tilde{\varphi}$ factors through a \mathbb{Z} -bilinear map

$$\varphi: (\mathbb{Z}/m\mathbb{Z}) \otimes_{\mathbb{Z}} (\mathbb{Z}/n\mathbb{Z}) \rightarrow \mathbb{Z}/d\mathbb{Z}$$

(such that $\varphi(x \otimes y) = \tilde{\varphi}(x, y)$).

- (3) To show that φ is isomorphic, might find the inverse map $\psi: \mathbb{Z}/d\mathbb{Z} \rightarrow (\mathbb{Z}/m\mathbb{Z}) \otimes_{\mathbb{Z}} (\mathbb{Z}/n\mathbb{Z})$ of φ . Define ψ by

$$\begin{array}{ccc} \psi: & \mathbb{Z}/d\mathbb{Z} & \longrightarrow (\mathbb{Z}/m\mathbb{Z}) \otimes_{\mathbb{Z}} (\mathbb{Z}/n\mathbb{Z}) \\ & \Downarrow & \Downarrow \\ & z + d\mathbb{Z} & \longmapsto (z + m\mathbb{Z}) \otimes (1 + n\mathbb{Z}). \end{array}$$

ψ is well-defined and \mathbb{Z} -linear.

- (4) $\psi \circ \varphi = \text{id}$.

- (5) $\varphi \circ \psi = \text{id}$.

Proof of (1).

- (a) $\tilde{\varphi}$ is well-defined. Say $x' = x + am$ for some $a \in \mathbb{Z}$ and $y' = y + bn$ for some $b \in \mathbb{Z}$. Then $x'y' - xy = yam + xbn + abmn \in \mathbb{Z}/d\mathbb{Z}$. That is, $\tilde{\varphi}$ is independent of coset representative.

(b) $\tilde{\varphi}$ is \mathbb{Z} -bilinear.

(i) For any $\lambda \in \mathbb{Z}$, $\tilde{\varphi}(\lambda x, y) = \tilde{\varphi}(x, \lambda y) = \lambda \tilde{\varphi}(x, y)$. In fact,

$$\begin{aligned}\tilde{\varphi}(\lambda(x + m\mathbb{Z}), y + n\mathbb{Z}) &= \tilde{\varphi}(\lambda x + m\mathbb{Z}, y + n\mathbb{Z}) = \lambda xy + d\mathbb{Z}, \\ \tilde{\varphi}(x + m\mathbb{Z}, \lambda(y + n\mathbb{Z})) &= \tilde{\varphi}(x + m\mathbb{Z}, \lambda y + n\mathbb{Z}) = \lambda xy + d\mathbb{Z}, \\ \tilde{\varphi}(x_1 + m\mathbb{Z}, y + n\mathbb{Z}) &= \lambda(xy + d\mathbb{Z}) = \lambda xy + d\mathbb{Z}.\end{aligned}$$

(ii) $\tilde{\varphi}(x_1 + x_2, y) = \tilde{\varphi}(x_1, y) + \tilde{\varphi}(x_2, y)$. In fact,

$$\begin{aligned}\tilde{\varphi}((x_1 + x_2) + m\mathbb{Z}, y + n\mathbb{Z}) &= (x_1 + x_2)y + d\mathbb{Z}, \\ \tilde{\varphi}(x_1 + m\mathbb{Z}, y + n\mathbb{Z}) + \tilde{\varphi}(x_2 + m\mathbb{Z}, y + n\mathbb{Z}) &= (x_1 y + d\mathbb{Z}) + (x_2 y + d\mathbb{Z}) \\ &= (x_1 + x_2)y + d\mathbb{Z}.\end{aligned}$$

(iii) $\tilde{\varphi}(x, y_1 + y_2) = \tilde{\varphi}(x, y_1) + \tilde{\varphi}(x, y_2)$. Similar to (ii).

□

Proof of (3).

(a) ψ is well-defined. Say $z' = z + cd$ for some $c \in \mathbb{Z}$. Note that $d = \alpha m + \beta n$ for some $\alpha, \beta \in \mathbb{Z}$. Thus

$$\begin{aligned}\psi(z' + d\mathbb{Z}) &= \psi(z + cd + d\mathbb{Z}) \\ &= \psi(z + c(\alpha m + \beta n) + d\mathbb{Z}) \\ &= (z + c(\alpha m + \beta n) + m\mathbb{Z}) \otimes (1 + n\mathbb{Z}) \\ &= (z + c\beta n + m\mathbb{Z}) \otimes (1 + n\mathbb{Z}) \\ &= (z + m\mathbb{Z}) \otimes (1 + n\mathbb{Z}) + (c\beta n + m\mathbb{Z}) \otimes (1 + n\mathbb{Z}) \\ &= \psi(z + d\mathbb{Z}) + (1 + m\mathbb{Z}) \otimes (c\beta n + n\mathbb{Z}) \\ &= \psi(z + d\mathbb{Z}).\end{aligned}$$

(b) ψ is \mathbb{Z} -linear.

(i) For any $\lambda \in \mathbb{Z}$, $\psi(\lambda z) = \lambda \psi(z)$. In fact,

$$\begin{aligned}\psi(\lambda(z + d\mathbb{Z})) &= \psi(\lambda z + d\mathbb{Z}) = (\lambda z + m\mathbb{Z}) \otimes (1 + n\mathbb{Z}), \\ \lambda \psi(z + d\mathbb{Z}) &= \lambda((z + m\mathbb{Z}) \otimes (1 + n\mathbb{Z})) = (\lambda z + m\mathbb{Z}) \otimes (1 + n\mathbb{Z}).\end{aligned}$$

(ii) $\psi(z_1 + z_2) = \psi(z_1) + \psi(z_2)$.

$$\begin{aligned}\psi((z_1 + z_2) + d\mathbb{Z}) &= (z_1 + z_2 + m\mathbb{Z}) \otimes (1 + n\mathbb{Z}), \\ \psi(z_1 + d\mathbb{Z}) + \psi(z_2 + d\mathbb{Z}) &= (z_1 + m\mathbb{Z}) \otimes (1 + n\mathbb{Z}) + (z_2 + m\mathbb{Z}) \otimes (1 + n\mathbb{Z}) \\ &= (z_1 + z_2 + m\mathbb{Z}) \otimes (1 + n\mathbb{Z}).\end{aligned}$$

□

Proof of (4). For any $(x + m\mathbb{Z}) \otimes (y + n\mathbb{Z}) \in (\mathbb{Z}/m\mathbb{Z}) \otimes_{\mathbb{Z}} (\mathbb{Z}/n\mathbb{Z})$,

$$\begin{aligned}\psi(\varphi((x + m\mathbb{Z}) \otimes (y + n\mathbb{Z}))) &= \psi(xy + d\mathbb{Z}) \\ &= (xy + m\mathbb{Z}) \otimes (1 + n\mathbb{Z}) \\ &= (x + m\mathbb{Z}) \otimes (y + n\mathbb{Z}).\end{aligned}$$

□

Proof of (5). For any $z + d\mathbb{Z} \in \mathbb{Z}/d\mathbb{Z}$,

$$\begin{aligned}\varphi(\psi(z + d\mathbb{Z})) &= \varphi((z + m\mathbb{Z}) \otimes (1 + n\mathbb{Z})) \\ &= z + d\mathbb{Z}.\end{aligned}$$

□

Exercise 2.2.

Let A be a ring, \mathfrak{a} an ideal, M an A -module. Show that $(A/\mathfrak{a}) \otimes_A M$ is isomorphic to $M/\mathfrak{a}M$. (Hint: Tensor the exact sequence $0 \rightarrow \mathfrak{a} \rightarrow A \rightarrow A/\mathfrak{a} \rightarrow 0$ with M .)

Proof (Hint). There is a natural exact sequence E :

$$E : 0 \rightarrow \mathfrak{a} \xrightarrow{i} A \xrightarrow{\pi} A/\mathfrak{a} \rightarrow 0$$

where i is the inclusion map (and π is the projection map). Tensor E with M :

$$E' : \mathfrak{a} \otimes_A M \xrightarrow{i \otimes 1} A \otimes_A M \xrightarrow{\pi \otimes 1} (A/\mathfrak{a}) \otimes_A M \rightarrow 0$$

is exact, or

$$(A/\mathfrak{a}) \otimes_A M \cong A \otimes_A M / \text{im}(i \otimes 1).$$

By Proposition 2.14, There is an unique isomorphism $A \otimes_A M \rightarrow M$ defined by $a \otimes x \mapsto ax$. This isomorphism sends $\text{im}(i \otimes 1)$ to $\mathfrak{a}M$. Therefore,

$$(A/\mathfrak{a}) \otimes_A M \cong M/\mathfrak{a}M.$$

□

Proof (Brute-force).

(1) Define $\tilde{\varphi}$ by

$$\begin{array}{ccc} \tilde{\varphi}: & A/\mathfrak{a} \times M & \longrightarrow M/\mathfrak{a}M \\ & \Downarrow & \Downarrow \\ & (a + \mathfrak{a}, x) & \longmapsto ax + \mathfrak{a}M. \end{array}$$

$\tilde{\varphi}$ is well-defined and A -bilinear.

- (2) By the universal property, $\tilde{\varphi}$ factors through a A -bilinear map

$$\varphi: A/\mathfrak{a} \otimes_A M \rightarrow M/\mathfrak{a}M$$

(such that $\varphi(a \otimes x) = \tilde{\varphi}(a, x)$).

- (3) To show that φ is isomorphic, might find the inverse map $\psi: M/\mathfrak{a}M \rightarrow A/\mathfrak{a} \otimes_A M$ of φ . Define ψ by

$$\begin{array}{ccc} \psi: & M/\mathfrak{a}M & \longrightarrow A/\mathfrak{a} \otimes_A M \\ & \Downarrow & \Downarrow \\ & x + \mathfrak{a}M & \longmapsto (1 + \mathfrak{a}) \otimes x. \end{array}$$

ψ is well-defined and A -linear.

- (4) $\psi \circ \varphi = \text{id}$.

- (5) $\varphi \circ \psi = \text{id}$.

□

Exercise 2.3.

Let A be a local ring, M and N finitely generated A -modules. Prove that if $M \otimes_A N = 0$, then $M = 0$ or $N = 0$. (Hint: Let \mathfrak{m} be the maximal ideal, $k = A/\mathfrak{m}$ the residue field. Let $M_k = k \otimes_A M \cong M/\mathfrak{m}M$ by Exercise 2.2. By Nakayama's lemma, $M_k = 0 \implies M = 0$. But $M \otimes_A N = 0 \implies (M \otimes_A N)_k = 0 \implies M_k \otimes_k N_k = 0 \implies M_k = 0$ or $N_k = 0$ since M_k, N_k are vector spaces over a field.)

The conclusion might be false if A is not local. For example, Exercise 2.1.

Proof (Hint). Let \mathfrak{m} be the maximal ideal, $k = A/\mathfrak{m}$ the residue field. Let $M_k = k \otimes_A M$.

- (1) (*Base extension*) Show that $(M \otimes_A N)_k = M_k \otimes_k N_k$. In fact, by Proposition 2.14

$$\begin{aligned}
 (M \otimes_A N)_k &= k \otimes_A (M \otimes_A N) \\
 &= (k \otimes_A M) \otimes_A N \\
 &= M_k \otimes_A N \\
 &= (M_k \otimes_k k) \otimes_A N \\
 &= M_k \otimes_k (k \otimes_A N) \\
 &= M_k \otimes_k N_k.
 \end{aligned}$$

(2)

$$\begin{aligned}
 M \otimes_A N = 0 &\implies (M \otimes_A N)_k = 0 \\
 &\implies M_k \otimes_k N_k = 0 && ((1)) \\
 &\implies M_k = 0 \text{ or } N_k = 0 && (M_k, N_k: \text{ vector spaces}) \\
 &\implies M/\mathfrak{m}M = 0 \text{ or } M/\mathfrak{m}M = 0 && (\text{Exercise 2.2}) \\
 &\implies M = 0 \text{ or } N = 0. && (\text{Nakayama's lemma})
 \end{aligned}$$

□

Exercise 2.4.

Let M_i ($i \in I$) be any family of A -modules, and let M be their direct sum. Prove that M is flat \Leftrightarrow each M_i is flat.

Proof. Given any A -module homomorphism $f : N' \rightarrow N$.

- (1) Similar to Proposition 2.14(iii), we have two isomorphisms

(a)

$$\varphi : \bigoplus_{i \in I} (N' \otimes M_i) \cong N' \otimes_A \bigoplus_{i \in I} M_i$$

defined by

$$\varphi((x \otimes m_i)_{i \in I}) = x \otimes (m_i)_{i \in I}$$

where $x \in N'$, $m_i \in M_i$ ($i \in I$).

(b)

$$\psi : N \otimes_A \bigoplus_{i \in I} M_i \cong \bigoplus_{i \in I} (N \otimes M_i)$$

defined by

$$\psi(y \otimes (m_i)_{i \in I}) = (y \otimes m_i)_{i \in I}$$

where $y \in N$, $m_i \in M_i$ ($i \in I$).

(2) $f : N' \rightarrow N$ induces an A -module homomorphism

$$f \otimes \text{id}_M : N' \otimes_A M \rightarrow N \otimes_A M.$$

(3) $\psi \circ f \otimes \text{id}_M \circ \varphi$ defines an A -module homomorphism

$$\psi \circ f \otimes \text{id}_M \circ \varphi : \bigoplus_{i \in I} (N' \otimes M_i) \rightarrow \bigoplus_{i \in I} (N \otimes M_i)$$

which sends $(x \otimes m_i)_{i \in I}$ to $(f(x) \otimes m_i)_{i \in I}$. That is,

$$\psi \circ f \otimes \text{id}_M \circ \varphi = \bigoplus_{i \in I} f \otimes \text{id}_{M_i}$$

(4) Show that M is flat if and only if each M_i is flat. Suppose f is injective.

$$\begin{aligned} & M_i \text{ is flat } \forall i \in I \\ \iff & f \otimes \text{id}_{M_i} \text{ is injective } \forall i \in I \\ \iff & \bigoplus_{i \in I} f \otimes \text{id}_{M_i} \text{ is injective} && \text{(Injectivity)} \\ \iff & \psi \circ f \otimes \text{id}_M \circ \varphi \text{ is injective} && ((3)) \\ \iff & f \otimes \text{id}_M \text{ is injective} && (\varphi, \psi \text{ are isomorphic}) \\ \iff & M \text{ is flat.} \end{aligned}$$

□

Exercise 2.5.

Let $A[x]$ be the ring of polynomials in one indeterminate over a ring A . Prove that $A[x]$ is a flat A -algebra. (Hint: Use Exercise 2.4.)

Proof (Hint).

(1) A is a flat A -module by Proposition 2.14(iv).

(2) As an A -module,

$$A[x] \cong \bigoplus_{n \in \mathbb{Z}^+} Ax^n \cong \bigoplus_{n \in \mathbb{Z}^+} A$$

(since $Ax^n \cong A$).

(3) By Exercise 2.4, $A[x] \cong \bigoplus_{n \in \mathbb{Z}^+} A$ is flat.

□

Exercise 2.8.

- (i) If M and N are flat A -modules, then so is $M \otimes_A N$.
- (ii) If B is a flat A -algebra and N is a flat B -module, then N is flat as A -module.

Proof of (i). Given any exact sequence of A -modules $0 \rightarrow N_1 \rightarrow N_2 \rightarrow N_3 \rightarrow 0$. Since M is flat,

$$0 \rightarrow N_1 \otimes_A M \rightarrow N_2 \otimes_A M \rightarrow N_3 \otimes_A M \rightarrow 0$$

is exact. Since N is flat,

$$0 \rightarrow (N_1 \otimes_A M) \otimes_A N \rightarrow (N_2 \otimes_A M) \otimes_A N \rightarrow (N_3 \otimes_A M) \otimes_A N \rightarrow 0$$

is exact. By Proposition 2.14 (ii),

$$0 \rightarrow N_1 \otimes_A (M \otimes_A N) \rightarrow N_2 \otimes_A (M \otimes_A N) \rightarrow N_3 \otimes_A (M \otimes_A N) \rightarrow 0$$

is exact, or $M \otimes_A N$ is flat. \square

Proof of (ii). Given any exact sequence of A -modules $0 \rightarrow N_1 \rightarrow N_2 \rightarrow N_3 \rightarrow 0$. Since B is a flat A -algebra (A -module),

$$0 \rightarrow N_1 \otimes_A B \rightarrow N_2 \otimes_A B \rightarrow N_3 \otimes_A B \rightarrow 0$$

is exact. Since N is a flat B -module,

$$0 \rightarrow (N_1 \otimes_A B) \otimes_B N \rightarrow (N_2 \otimes_A B) \otimes_B N \rightarrow (N_3 \otimes_A B) \otimes_B N \rightarrow 0$$

is exact. By “Exercise 2.15” on page 27,

$$0 \rightarrow N_1 \otimes_A (B \otimes_B N) \rightarrow N_2 \otimes_A (B \otimes_B N) \rightarrow N_3 \otimes_A (B \otimes_B N) \rightarrow 0$$

is exact. By Proposition 2.14 (iv),

$$0 \rightarrow N_1 \otimes_A N \rightarrow N_2 \otimes_A N \rightarrow N_3 \otimes_A N \rightarrow 0$$

is exact, or N is flat. \square

Exercise 2.9.

Let $0 \rightarrow M' \rightarrow M \rightarrow M'' \rightarrow 0$ be an exact sequence of A -modules. If M' and M'' are finitely generated, then so is M .

Proof.

(1) Write

$$0 \rightarrow M' \xrightarrow{f} M \xrightarrow{g} M'' \rightarrow 0.$$

Also write

$$\begin{aligned} x_1, \dots, x_n &\text{ as generators of } M', \\ z_1, \dots, z_m &\text{ as generators of } M'' \end{aligned}$$

(since M' and M'' are finitely generated).

(2) Since the map $g : M \rightarrow M''$ is surjective, there exists $y_j \in M$ such that $g(y_j) = z_j$ for $j = 1, \dots, m$.

(3) Show that M is generated by

$$f(x_1), \dots, f(x_n), y_1, \dots, y_m.$$

Given any $y \in M$.

$$\begin{aligned} y \in M &\implies g(y) \in M'' \\ &\implies g(y) = \sum_{j=1}^m s_j z_j \text{ where } s_j \in A \\ &\implies g(y) = \sum_{j=1}^m s_j g(y_j) \\ &\implies g(y) = g\left(\sum_{j=1}^m s_j y_j\right) \\ &\implies y - \sum_{j=1}^m s_j y_j \in \ker(g) = \operatorname{im}(f) \\ &\implies \exists x \in M' \text{ such that } f(x) = y - \sum_{j=1}^m s_j y_j \end{aligned}$$

Write $x = \sum_{i=1}^n r_i x_i$ where $r_i \in A$. So,

$$\begin{aligned} y \in M &\implies f\left(\sum_{i=1}^n r_i x_i\right) = y - \sum_{j=1}^m s_j y_j \\ &\implies \sum_{i=1}^n r_i f(x_i) = y - \sum_{j=1}^m s_j y_j \\ &\implies y = \sum_{i=1}^n r_i f(x_i) + \sum_{j=1}^m s_j y_j. \end{aligned}$$

Hence, every $y \in M$ is a linear combination of $f(x_1), \dots, f(x_n), y_1, \dots, y_m$, or M is finitely generated (by $f(x_1), \dots, f(x_n), y_1, \dots, y_m$).

□
