# Chapter I: Varieties

## I.1 Affine Varieties

### Exercise I.1.2. (Twisted cubic curve)

Let  $Y \subseteq \mathbf{A}^3$  be the set  $Y = \{(t, t^2, t^3) : t \in k\}$ . Show that  $Y$  is an affine variety of dimension 1. Find generators for the ideal  $I(Y)$ . Show that  $A(Y)$  is isomorphic to a polynomial ring in one variable over  $k$ . We say that  $Y$  is given by the **parametric representation**  $x = t, y = t^2, z = t^3$ .

*Proof.*

- (1) Note that

$$Y = Z(x^2 - y, x^3 - z)$$

is an algebraic set. Hence  $I(Y)$  is the radical of  $\mathfrak{a} := (x^2 - y, x^3 - z)$ . To show  $I(Y) = \mathfrak{a}$ , it suffices to show that  $\mathfrak{a}$  is prime.

- (2) Show that  $A/\mathfrak{a} \cong k[t]$  is a domain.

- (a) Define a ring homomorphism  $\alpha : A/\mathfrak{a} \rightarrow k[t]$  by

$$\alpha : f(x, y, z) + \mathfrak{a} \mapsto f(t, t^2, t^3).$$

$\alpha$  is well-defined since  $\alpha((x^2 - y) + \mathfrak{a}) = 0$  and  $\alpha((x^3 - z) + \mathfrak{a}) = 0$ .

- (b)  $\alpha$  is surjective since  $\alpha(g(x) + \mathfrak{a}) = g(t)$  for any  $g(t) \in k[t]$ .

- (c) Show that  $\alpha$  is injective. Suppose  $\alpha(f(x, y, z) + \mathfrak{a}) = 0$ . Write

$$\begin{aligned} f(x, y, z) + \mathfrak{a} &= \sum_{(i)} \lambda_{(i)} x^{i_1} (y - x^2)^{i_2} (z - x^3)^{i_3} + \mathfrak{a} \\ &= \sum_i \lambda_i x^i + \mathfrak{a}. \end{aligned}$$

So

$$0 = \alpha(f(x, y, z) + \mathfrak{a}) = \alpha\left(\sum_i \lambda_i x^i + \mathfrak{a}\right) = \sum_i \lambda_i t^i.$$

Hence  $f(x, y, z) + \mathfrak{a} = \mathfrak{a}$ .

- (3) Hence  $Y$  is an affine variety of dimension 1 since  $A(Y)$  is isomorphic to a polynomial ring in one variable  $t$  over  $k$  (Proposition I.1.7). Also,  $I(Y) = \mathfrak{a} = (x^2 - y, x^3 - z)$  is generated by  $x^2 - y$  and  $x^3 - z$ .

- (4) Also see Problems 2.7 and 2.8 in the textbook: *William Fulton, Algebraic Curves*. If  $\varphi : V \rightarrow W$  is a polynomial map, and  $X$  is an algebraic subset of  $W$ , show that  $\varphi^{-1}(X)$  is an algebraic subset of  $V$ . If  $\varphi^{-1}(X)$  is irreducible, and  $X$  is contained in the image of  $\varphi$ , show that  $X$  is irreducible. This gives a useful test for irreducibility.

□

**Exercise I.1.4.**

If we identify  $\mathbf{A}^2$  with  $\mathbf{A}^1 \times \mathbf{A}^1$  in the natural way, show that the Zariski topology on  $\mathbf{A}^2$  is not the product topology of the Zariski topologies on the two copies of  $\mathbf{A}^1$ .

*Proof.*

- (1) Let  $\Delta = \{P \times P : P \in \mathbf{A}^1\}$  be the diagonal subset of  $\mathbf{A}^2$ .
- (2)  $\Delta$  is a proper closed subset ( $= Z(x - y)$ ) of  $\mathbf{A}^2$ . However,  $\Delta$  is not a finite union of horizontal and vertical lines and points (Example I.1.1.2). Hence  $\Delta$  is not a closed set in the product topology of  $\mathbf{A}^1 \times \mathbf{A}^1$ .

□

**Exercise I.1.6.**

Any nonempty open subset of an irreducible topological space is dense and irreducible. If  $Y$  is a subset of a topological space  $X$ , which is irreducible in its induced topology, then the closure  $\bar{Y}$  is also irreducible.

*Proof.*

- (1) Show that any nonempty open subset of an irreducible topological space is dense. It suffices to show that  $U_1 \cap U_2 \neq \emptyset$  for any nonempty open subsets of an irreducible topological space.

$$\begin{aligned}
& \forall \text{ nonempty open sets } U_1 \text{ and } U_2, U_1 \cap U_2 \neq \emptyset \\
& \iff \forall \text{ nonempty open sets } U_1 \text{ and } U_2, X - (U_1 \cap U_2) \neq X \\
& \iff \forall \text{ nonempty open sets } U_1 \text{ and } U_2, (X - U_1) \cup (X - U_2) \neq X \\
& \iff \forall \text{ proper closed sets } Y_1 \text{ and } Y_2, Y_1 \cup Y_2 \neq X \\
& \iff \nexists \text{ proper closed sets } Y_1 \text{ and } Y_2, Y_1 \cup Y_2 = X.
\end{aligned}$$

- (2) Show that any nonempty open subset of an irreducible topological space is irreducible. Given any open subset  $U$  of an irreducible topological space  $X$ . Write  $U \subseteq Y_1 \cup Y_2$  where  $Y_1$  and  $Y_2$  are closed in  $X$ .

$$\begin{aligned}
 &U \subseteq Y_1 \cup Y_2 \\
 \implies &\overline{U} \subseteq \overline{Y_1 \cup Y_2} \\
 \implies &X \subseteq Y_1 \cup Y_2 && (U \text{ is dense, } Y_1 \cup Y_2 \text{ is closed}) \\
 \implies &Y_1 = X \supseteq U \text{ or } Y_2 = X \supseteq U && (X \text{ is irreducible}) \\
 \implies &U \text{ is irreducible.}
 \end{aligned}$$

- (3) Show that if  $Y$  is a subset of a topological space  $X$ , which is irreducible (in its induced topology), then the closure  $\overline{Y}$  is also irreducible. (Reductio ad absurdum) If  $\overline{Y}$  were reducible, there are two closed sets  $Y_1$  and  $Y_2$  such that

$$\overline{Y} \subseteq Y_1 \cup Y_2, \overline{Y} \not\subseteq Y_i (i = 1, 2).$$

- (a)  $Y \subseteq \overline{Y} \subseteq Y_1 \cup Y_2$ .  
 (b)  $Y \not\subseteq Y_i (i = 1, 2)$ . If not,  $Y \subseteq Y_i$  for some  $i$ . Take closure to get  $\overline{Y} \subseteq \overline{Y_i} = Y_i$  (since  $Y_i$  is closed), contrary to the assumption.

By (a)(b),  $Y$  is reducible, which is absurd.

## I.8 What is Algebraic Geometry?

No exercises.

## Chapter II: Schemes

### II.1 Sheaves

#### Exercise II.1.1. (Constant presheaf)

Let  $A$  be an abelian group, and define the **constant presheaf** associated to  $A$  on the topological space  $X$  to be the presheaf  $U \mapsto A$  for all  $U \neq \emptyset$ , with restriction maps the identity. Show that the constant sheaf  $\mathcal{A}$  defined in the text is the sheaf associated to this presheaf.

*Proof.*

- (1) Let  $\mathcal{F}$  be the constant presheaf.
- (2) Let  $\theta : \mathcal{F} \rightarrow \mathcal{A}$  be a morphism consists of a morphism of abelian groups  $\theta(U) : \mathcal{F}(U) = A \rightarrow \mathcal{A}(U)$  for each open set  $U \subseteq X$  such that  $\theta(U)(a) = f_a : x \mapsto a$  for each element  $x \in U$ . (It is well-defined.)
- (3) Given any sheaf  $\mathcal{G}$  and any morphism  $\varphi : \mathcal{F} \rightarrow \mathcal{G}$ , it suffices to find a morphism  $\psi : \mathcal{A} \rightarrow \mathcal{G}$  such that  $\varphi = \psi \circ \theta$ .
- (4) Given an open set  $U \subseteq X$ . Suppose  $f \in \mathcal{A}(U)$  is a continuous maps of  $U$  into  $A$ . Since  $A$  is equipped with the discrete topology,  $f$  is locally constant, that is,

$$f(V_i) = a_i$$

where each  $V_i$  is a connected component of  $U$ . (In particular,  $\{V_i\}$  is an open covering of  $U$ .)

- (5) Now

$$s_i := \varphi(V_i)(a_i) \in \mathcal{G}(V_i)$$

is defined. Since  $\mathcal{G}$  is a sheaf and all  $V_i$  are disjoint, there is a  $s \in \mathcal{G}(U)$  such that  $s|_{V_i} = s_i$  for each  $i$ . Now we define  $\psi(U)$  by

$$\psi(U)(f) = s.$$

Thus  $\psi$  is a morphism and  $\varphi = \psi \circ \theta$  by construction.
