Chapter I: Algebraic Integers

I.1. The Gaussian Integers

Exercise I.1.1.

$\alpha \in \mathbb{Z}[i]$ is a unit if and only if $N(\alpha) = 1$.

Proof.

- (1) (\implies) Since α is a unit, there is $\beta \in \mathbb{Z}[i]$ such that $\alpha\beta = 1$. So $N(\alpha\beta) = N(1)$, or $N(\alpha)N(\beta) = 1$. Since the image of N is nonnegative integers, $N(\alpha) = 1$.
- (2) (\impliedby) $N(\alpha) = \alpha\bar{\alpha}$, or $1 = \alpha\bar{\alpha}$ since $N(\alpha) = 1$. That is, $\bar{\alpha} \in \mathbb{Z}[i]$ is the inverse of $\alpha \in \mathbb{Z}[i]$. (Or we solve the equation $N(\alpha) = a^2 + b^2 = 1$, and show that all four solutions (± 1 and $\pm i$) are units.)
- (3) Conclusion: a unit $\alpha = a + bi$ of $\mathbb{Z}[i]$ is satisfying the equation $N(\alpha) = a^2 + b^2 = 1$ by (1)(2). That is, the only unit of $\mathbb{Z}[i]$ are ± 1 and $\pm i$.

□

Exercise I.1.4.

Show that the ring $\mathbb{Z}[i]$ cannot be ordered.

Proof. Similar to the fact that i cannot be ordered in \mathbb{C} . Thus i cannot be ordered in $\mathbb{Z}[i]$ either. □

Exercise I.1.5.

Show that the only units of the ring $\mathbb{Z}[\sqrt{-d}] = \mathbb{Z} + \mathbb{Z}\sqrt{-d}$, for any rational integer $d > 1$, are ± 1 .

Proof.

- (1) Define the norm N on $\mathbb{Z}[\sqrt{-d}]$ by

$$N(x + y\sqrt{-d}) = (x + y\sqrt{-d})(x - y\sqrt{-d}) = x^2 + y^2d,$$

i.e., by $N(z) = |z|^2$. It is multiplicative.

(2) Similar to Exercise I.1.1,

$$\begin{aligned} x + y\sqrt{-d} \in \mathbb{Z}[\sqrt{-d}] \text{ is a unit} &\iff N(x + y\sqrt{-d}) = x^2 + y^2d = 1 \\ &\iff x^2 = 1 \text{ and } y = 0 \\ &\iff x = \pm 1 \text{ and } y = 0. \end{aligned}$$

Hence the only units of the ring $\mathbb{Z}[\sqrt{-d}]$ are ± 1 ($d > 1$).

□

I.2. Integrality

Exercise I.2.1.

Is $\frac{3+2\sqrt{6}}{1-\sqrt{6}}$ an algebraic integer?

Proof.

- (1) $\alpha := \frac{3+2\sqrt{6}}{1-\sqrt{6}} = -3 - \sqrt{6}$. Since the set of all algebraic integers is a ring, α is an algebraic integer.
- (2) Or show that α satisfies a monic equation $x^2 + 6x + 3 = 0 \in \mathbb{Z}[x]$.

□

Exercise I.2.2.

Show that, if the integral domain A is integrally closed, then so is the polynomial ring $A[t]$.

Proof.

- (1) Suppose A is integrally closed in B . Show that $A[t]$ is integrally closed in $B[t]$. Suppose $f \in B[t]$ is integral over $A[t]$. Write

$$f^n + g_1 f^{n-1} + \cdots + g_{n-1} f + g_n = 0$$

where $n > 0$ and $g_i \in A[t]$. Hence

$$\begin{aligned} f^n + g_1 f^{n-1} + \cdots + g_{n-1} f &= -g_n \in A[t] \\ \implies f \underbrace{(f^{n-1} + g_1 f^{n-2} + \cdots + g_{n-1})}_{:=g} &\in A[t]. \end{aligned}$$

It is possible to show that $fg \in A[t]$ implies that $f \in A[t]$ and $g \in A[t]$ by using the fact that A is integrally closed in B .

- (2) Suppose f, g are monic polynomials in $B[t]$. Show that $fg \in A[t]$ implies that $f \in A[t]$ and $g \in A[t]$. Write

$$f = \prod (t - \xi_i), \quad g = \prod (t - \eta_j)$$

in some splitting field F of f and g containing the quotient field of B . Note that each ξ_i and each η_j is a root of a monic equation fg in $A[t]$. Since A is integrally closed in B , $\xi_i, \eta_j \in A$. Hence $f, g \in A[t]$.

- (3) To apply part (2), we need to remedy leading coefficients of f and g . Take an integer $m > \max\{\deg(f), \deg(g_1), \dots, \deg(g_n)\}$. Let $f_0 = t^m + f$ be a monic polynomial in $B[t]$. Hence

$$\begin{aligned} (f_0 - t^m)^n + g_1(f_0 - t^m)^{n-1} + \dots + g_n &= 0 \\ \implies f_0^n + h_1 f_0^{n-1} + \dots + h_n &= 0 \end{aligned}$$

where

$$h_n = t^{mn} + (-1)^{n-1} g_1 t^{m(n-1)} + \dots + g_n \in A[t]$$

is also monic. So

$$\begin{aligned} f_0^n + h_1 f_0^{n-1} + \dots + h_{n-1} f &= -h_n \text{ is monic in } A[t] \\ \implies f_0 (\underbrace{f_0^{n-1} + h_1 f_0^{n-2} + \dots + h_{n-1}}_{:=h_0}) &\in A[t] \text{ where} \\ f_0 \text{ and } h_0 &\text{ both are monic in } B[t]. \end{aligned}$$

Now we can apply part (2) safely.

- (4) In part (1), we let B be the quotient field of A and thus the quotient field of $A[t]$ is $B(t)$. Hence

$$\begin{aligned} f &\in B(t) \text{ integral over } A[t] \\ \implies f &\in B(t) \text{ integral over } B[t] & (A[t] \subseteq B[t]) \\ \implies f &\in B[t] & (B[t] \text{ is a UFD}) \\ \implies f &\in B[t] \text{ integral over } A[t] \\ \implies f &\in A[t]. & ((1)) \end{aligned}$$

□

Exercise I.2.3.

In the polynomial ring $A = \mathbb{Q}[x, y]$, consider the principal ideal $\mathfrak{p} = (x^2 - y^3)$. Show that \mathfrak{p} is a prime ideal, but A/\mathfrak{p} is not integrally closed.

Proof.

- (1) It is easy to show that $x^2 - y^3$ is irreducible in A . Hence $\mathfrak{p} = (x^2 - y^3)$ is prime since A is a UFD.
- (2) By substituting $x = t^3$, $y = t^2$, $A/\mathfrak{p} \cong \mathbb{Q}[t^3, t^2]$, with quotient field $\mathbb{Q}(t)$ (by noting $t = \frac{x}{y}$). Note that $\mathbb{Q}[t]$ is a UFD, thus is already integrally closed. So the integral closure will be $\mathbb{Q}[t] \supsetneq \mathbb{Q}[t^3, t^2]$. It suggests that A/\mathfrak{p} might not be integrally closed.
- (3) (Reductio ad absurdum) If not, then the element $\frac{x}{y}$ satisfies a monic equation $t^2 - y = 0 \in (A/\mathfrak{p})[t]$. So $\frac{x}{y} \in A/\mathfrak{p}$ or $t \in \mathbb{Q}[t^3, t^2]$, which is absurd.

□

Note.

- (1) Serre's criterion for normality.
- (2) Hence smoothness is the same as normality for affine curves in $\mathbb{Q}[x, y]$. Note that $x^2 - y^3$ is an irreducible cubic with a cusp at the origin $(0, 0)$.
- (3) There is an affine variety $X \in \mathbb{Q}[x, y, z]$ such that X is normal but not smooth. ($X = V(x^2 + y^2 - z^2)$ for example.)

Exercise I.2.4.

Let D be a squarefree rational integer $\neq 0, 1$ and d the discriminant of the quadratic number field $K = \mathbb{Q}(\sqrt{D})$. Show that

$$d = \begin{cases} D & \text{if } D \equiv 1 \pmod{4}, \\ 4D & \text{if } D \equiv 2, 3 \pmod{4}. \end{cases}$$

and that an integral basis of K is given by $\{1, \sqrt{D}\}$ in the second case, by $\left\{1, \frac{1+\sqrt{D}}{2}\right\}$ in the first case, and by $\left\{1, \frac{d+\sqrt{d}}{2}\right\}$ in both case.

Proof.

- (1) The Galois group of $K|\mathbb{Q}$ has two elements, the identity and an automorphism sending \sqrt{D} to $-\sqrt{D}$.
- (2) Note that $\alpha \in \mathcal{O}_K$ iff $\text{Tr}_{K|\mathbb{Q}}(\alpha), N_{K|\mathbb{Q}}(\alpha) \in \mathbb{Z}$ (by noting that the equation $x^2 - \text{Tr}_{K|\mathbb{Q}}(\alpha)x + N_{K|\mathbb{Q}}(\alpha) = 0$ has a root $x = \alpha$). So given $\alpha = x + y\sqrt{D} \in \mathcal{O}_K$, we have

$$\begin{aligned} \text{Tr}_{K|\mathbb{Q}}(\alpha) &= 2x \in \mathbb{Z}, \\ N_{K|\mathbb{Q}}(\alpha) &= x^2 - Dy^2 \in \mathbb{Z}. \end{aligned}$$

(3) So $4(x^2 - Dy^2) = (2x)^2 - D(2y)^2 \in \mathbb{Z}$. So $D(2y)^2 \in \mathbb{Z}$ since $2x \in \mathbb{Z}$. So $2y \in \mathbb{Z}$ since D is squarefree $\neq 0, 1$. Let $r = 2x, s = 2y$. Then $r^2 -Ds^2 \equiv 0 \pmod{4}$. Note that a square $\equiv 0, 1 \pmod{4}$.

(4) If $D \equiv 1 \pmod{4}$, then

$$\begin{aligned} r^2 - Ds^2 &\equiv r^2 - s^2 \pmod{4} \\ \implies r \text{ and } s \text{ has the same parity} \\ \implies \mathcal{O}_K &= \left\{ \frac{r + s\sqrt{D}}{2} : r \equiv s \pmod{2} \right\} \\ \implies \mathcal{O}_K &= \left\{ \frac{r-s}{2} + s \cdot \frac{1+\sqrt{D}}{2} : r \equiv s \pmod{2} \right\} \\ \implies \mathcal{O}_K &= \mathbb{Z} + \mathbb{Z} \frac{1+\sqrt{D}}{2}. \end{aligned}$$

So $\left\{1, \frac{1+\sqrt{D}}{2}\right\}$ is an integral basis of K . Hence

$$d = \begin{vmatrix} 1 & \frac{1+\sqrt{D}}{2} \\ 1 & \frac{1-\sqrt{D}}{2} \end{vmatrix}^2 = D.$$

(5) If $D \equiv 2, 3 \pmod{4}$, then

$$\begin{aligned} r^2 - Ds^2 &\equiv r^2 + 2s^2 \text{ or } r^2 + s^2 \pmod{4} \\ \implies \text{both } r \text{ and } s \text{ are even} \\ \implies \text{both } x \text{ and } y \text{ are rational integers} \\ \implies \mathcal{O}_K &= \mathbb{Z} + \mathbb{Z}\sqrt{D}. \end{aligned}$$

So $\{1, \sqrt{D}\}$ is an integral basis of K . Hence

$$d = \begin{vmatrix} 1 & \sqrt{D} \\ 1 & -\sqrt{D} \end{vmatrix}^2 = 4D.$$

(6) By (4)(5), $\left\{1, \frac{d+\sqrt{d}}{2}\right\}$ is an integral basis of K for any case.

□

Exercise I.2.7. (Stickelberger's discriminant relation)

The discriminant d_K of an algebraic number field K is always $\equiv 0 \pmod{4}$ or $\equiv 1 \pmod{4}$. (Hint: The discriminant $\det(\sigma_i \omega_j)$ of an integral basis ω_j

is a sum of terms, each prefixed by a positive or a negative sign. Writing P (resp. N) for the sum of the positive (resp. negative) terms, one find $d_K = (P - N)^2 = (P + N)^2 - 4PN$.)

Proof (Hint).

- (1) Let S_n be the symmetric group of degree n , and A_n be the alternating group of degree n . So

$$\begin{aligned} \det(\sigma_i \omega_j) &= \sum_{\pi \in S_n} \left(\operatorname{sgn}(\pi) \prod_{i=1}^n \sigma_i \omega_{\pi(i)} \right) \\ &= \underbrace{\sum_{\pi \in A_n} \prod_{i=1}^n \sigma_i \omega_{\pi(i)}}_{:=P} - \underbrace{\sum_{\pi \in S_n - A_n} \prod_{i=1}^n \sigma_i \omega_{\pi(i)}}_{:=N}. \end{aligned}$$

- (2) Note that $\sigma_i(P + N) = P + N$ and $\sigma_i(PN) = PN$ for all σ_i . Hence $P + N, PN \in \mathbb{Q}$. Therefore $P + N, PN \in \mathbb{Q} \cap \mathcal{O}_K = \mathbb{Z}$.

- (3) By (1)(2),

$$\begin{aligned} d_K &= \det(\sigma_i \omega_j)^2 \\ &= (P - N)^2 \\ &= (P + N)^2 - 4PN \\ &\equiv 0, 1 \pmod{4}. \end{aligned}$$

□

I.3. Ideals

Exercise I.3.4.

A Dedekind domain with a finite number of prime ideals is a principal ideal domain. (Hint: If $\mathfrak{a} = \mathfrak{p}_1^{\nu_1} \cdots \mathfrak{p}_r^{\nu_r} \neq 0$ is an ideal, then choose elements $\pi_i \in \mathfrak{p}_i \setminus \mathfrak{p}_i^2$ and apply the Chinese remainder theorem for the cosets $\pi_i^{\nu_i} \pmod{\mathfrak{p}_i^{\nu_i+1}}$.)

Proof.

- (1) The hint gives all.
- (2) The existence of π_i is guaranteed by Theorem I.3.3 (the unique prime factorization). The Chinese remainder theorem shows that there is one element $\pi \in \mathcal{O}$ such that $\pi = \pi_i^{\nu_i} \pmod{\mathfrak{p}_i^{\nu_i+1}}$ for each i .

- (3) Hence $\mathfrak{p} = (\pi)$ since they have the same prime factorization.

□

Exercise I.3.5.

The quotient ring \mathcal{O}/\mathfrak{a} of a Dedekind domain by an ideal $\mathfrak{a} \neq 0$ is a principal ideal domain. (Hint: For $\mathfrak{a} = \mathfrak{p}^n$ the only proper ideals of \mathcal{O}/\mathfrak{a} are given by $\mathfrak{p}/\mathfrak{p}^n, \dots, \mathfrak{p}^{n-1}/\mathfrak{p}^n$. Choose $\pi \in \mathfrak{p} \setminus \mathfrak{p}^2$ and show that $\mathfrak{p}^\nu = \mathcal{O}\pi^\nu + \mathfrak{p}^n$.)

Proof.

- (1) By the Chinese remainder theorem, it suffices to show the case $\mathfrak{a} = \mathfrak{p}^n$ where \mathfrak{p} is prime.
- (2) There is a natural correspondence between

$$\{\text{ideals of } \mathcal{O}/\mathfrak{p}^n\} \longleftrightarrow \{\text{ideals of } \mathcal{O} \text{ containing } \mathfrak{p}^n\}.$$

Hence the proper ideals of $\mathcal{O}/\mathfrak{p}^n$ are given by $\mathfrak{p}/\mathfrak{p}^n, \dots, \mathfrak{p}^{n-1}/\mathfrak{p}^n$.

- (3) Similar to Exercise I.3.4, choose $\pi \in \mathfrak{p} \setminus \mathfrak{p}^2$ and thus $\mathfrak{p}^\nu = \mathcal{O}\pi^\nu + \mathfrak{p}^n$ ($\nu = 1, \dots, n-1$) since they have the same prime factorization. Hence $\mathfrak{p}^\nu/\mathfrak{p}^n = (\pi^\nu + \mathfrak{p}^n)$ is principal.

□

Exercise I.3.6.

Every ideal of a Dedekind domain can be generated by two elements. (Hint: Use Exercise I.3.5.)

Proof.

- (1) Given an ideal $\mathfrak{a} \neq 0$ of a Dedekind domain \mathcal{O} . (Nothing to do if $\mathfrak{a} = 0 = (0)$.) So \mathcal{O}/\mathfrak{a} is a principal ideal domain (Exercise I.3.5).
- (2) Take any $\alpha \in \mathfrak{a} \setminus \{0\}$. So $(\alpha)/\mathfrak{a} = (\beta \pmod{\mathfrak{a}})$ is a principal ideal for some $\beta \in \mathcal{O}$. So $\mathfrak{a} = (\alpha, \beta)$ is generated by two elements.

□

I.4. Lattices

Exercise I.4.1.

Show that a lattice Γ in \mathbb{R}^n is complete if and only if the quotient \mathbb{R}^n/Γ is compact.

Proof.

- (1) (\implies) Define a natural homeomorphism $\varphi : \mathbb{R}^n/\Gamma \rightarrow \mathbb{S}^1 \times \cdots \times \mathbb{S}^1$ by sending (x_1, \dots, x_n) to $(x_1 \pmod{1}, \dots, x_n \pmod{1})$ (where $\mathbb{S}^1 \subseteq \mathbb{R}^2$ is a unit circle). Note that $\mathbb{S}^1 \times \cdots \times \mathbb{S}^1$ is compact.
- (2) (\impliedby) Let V_0 be the linear subspace of V which is spanned by the set Γ . Since the vector space V/V_0 is contained in a compact set V/Γ ,

$$\dim(V/V_0) = 0$$

(otherwise V/V_0 is unbounded). Hence $V_0 = V$ or Γ is complete.

□

Exercise I.4.2.

Show that Minkowski's lattice point theorem cannot be improved, by giving an example of a centrally symmetric convex set $X \subset V$ such that $\text{vol}(X) = 2^n \text{vol}(\Gamma)$ which does not contain any nonzero point of the lattice Γ . If X is compact, however, then the statement $\text{vol}(X) > 2^n \text{vol}(\Gamma)$ does remain true in the case of equality.

Proof.

- (1) Let $V = \mathbb{R}^n$, $\Gamma = \mathbb{Z}^n$ be a complete lattice in V , and $X = (-1, 1)^n \subseteq \mathbb{R}^n$ be a centrally symmetric convex set in V . Hence $\text{vol}(X) = 2^n \text{vol}(\Gamma)$ and X does not contain any nonzero point of Γ .
- (2) Suppose X is compact. Consider $X_\nu = (1 + \frac{1}{\nu})X$ for each $\nu \in \mathbb{Z}_{>0}$. Thus X_ν is again a centrally symmetric convex set in V and

$$\begin{aligned} \text{vol}(X_\nu) &= \left(1 + \frac{1}{\nu}\right) \text{vol}(X) \\ &\geq \left(1 + \frac{1}{\nu}\right) 2^n \text{vol}(\Gamma) \\ &> 2^n \text{vol}(\Gamma). \end{aligned}$$

Minkowski's lattice point theorem shows that there is one nonzero lattice point $\gamma_\nu \in \Gamma$ for $\nu = 1, 2, 3, \dots$

- (3) By the compactness of X_1 , there is a subsequence of $\{\gamma_\nu\}$ converging to $\gamma \in X_1$. Since Γ is discrete (Proposition I.4.2), there are infinitely many ν such that $\gamma = \gamma_\nu \in X_\nu$. (In particular, $\gamma \neq 0$.) Hence $\gamma \in X$ by the compactness of X .

□

I.5. Minkowski Theory

Exercise I.5.2.

Show that the convex, centrally symmetric set

$$X = \left\{ (z_\tau) \in K_{\mathbb{R}} : \sum_{\tau} |z_\tau| < t \right\}$$

has volume $\text{vol}(X) = 2^r \pi^s \frac{t^n}{n!}$.

Proof. It is the same as Lemma III.2.15. □

Exercise I.5.3. (Minkowski bound)

Show that in every ideal $\mathfrak{a} \neq 0$ of \mathcal{O}_K there exists an $a \neq 0$ such that

$$|N_{K|\mathbb{Q}}(a)| \leq M(\mathcal{O}_K : \mathfrak{a}),$$

where $M = \frac{n!}{n^n} \left(\frac{4}{\pi}\right)^s \sqrt{|d_K|}$ (the so-called **Minkowski bound**.)

Proof.

- (1) Let

$$X_t = \left\{ (z_\tau) \in K_{\mathbb{R}} : \sum_{\tau} |z_\tau| \leq t \right\}$$

be a convex, centrally symmetric set for any $t > 0$. Note that $\text{vol}(X_t) = 2^r \pi^s \frac{t^n}{n!}$ (same as Exercise I.5.2).

- (2) In particular, we take $t > 0$ so that

$$\text{vol}(X_t) = 2^r \pi^s \frac{t^n}{n!} = 2^n \text{vol}(\Gamma).$$

Thus the hypothesis of Minkowski's lattice point theorem in Exercise I.4.2 is satisfied. So there does indeed exist a lattice point $ja \in X_t$, $a \neq 0$, $a \in \mathfrak{a}$; in other words, $\sum_{\tau} |\tau a| \leq t$.

(3) Hence

$$\begin{aligned}
|N_{K|\mathbb{Q}}(a)| &= \prod_{\tau} |\tau a| \\
&\leq \left(\frac{1}{n} \sum_{\tau} |\tau a| \right)^n && \text{(AM-GM inequality)} \\
&\leq \frac{t^n}{n^n} && (ja \in X_t) \\
&= \frac{1}{n^n} \frac{n!}{2^r \pi^s} 2^n \text{vol}(\Gamma) && \text{(Definition of } t^n) \\
&= \frac{1}{n^n} \frac{n!}{2^r \pi^s} 2^n \sqrt{|d_K|} (\mathcal{O}_K : \mathfrak{a}) && \text{(Proposition I.5.2)} \\
&= \underbrace{\frac{n!}{n^n} \left(\frac{4}{\pi} \right)^s}_{:=M} \sqrt{|d_K|} (\mathcal{O}_K : \mathfrak{a}). && (n = r + 2s)
\end{aligned}$$

□

I.6. The Class Number

Exercise I.6.3.

Show that in every ideal class of an algebraic number field K of degree n , there exists an integral ideal \mathfrak{a}_1 such that

$$\mathfrak{N}(\mathfrak{a}_1) \leq \frac{n!}{n^n} \left(\frac{4}{\pi} \right)^s \sqrt{|d_K|}$$

(Hint: Use Exercise I.3.5, proceed as in the proof of Theorem I.6.3.)

Proof.

- (1) The hint gives all.
- (2) Take an arbitrary representative \mathfrak{a} of the class in the ideal class group, and a $\gamma \in \mathcal{O}_K$, $\gamma \neq 0$, such that $\mathfrak{b} := \gamma \mathfrak{a}^{-1} \subseteq \mathcal{O}_K$. By Exercise I.3.5, there exists $\alpha \in \mathfrak{b}$, $\alpha \neq 0$, such that

$$|N_{K|\mathbb{Q}}(\alpha)| \cdot \mathfrak{N}(\mathfrak{b})^{-1} = \mathfrak{N}((\alpha)\mathfrak{b}^{-1}) = \mathfrak{N}(\alpha\mathfrak{b}^{-1}) \leq \frac{n!}{n^n} \left(\frac{4}{\pi} \right)^s \sqrt{|d_K|}.$$

The ideal

$$\mathfrak{a}_1 := \alpha \mathfrak{b}^{-1} = \alpha \gamma^{-1} \mathfrak{a} \in [\mathfrak{a}]$$

therefore has the required property.

(3) This exercise also shows that Cl_K is a finite group.

□

Chapter VII: Zeta Functions and L -series

VII.1. The Riemann Zeta Function

Exercise VII.1.4.

For the power sum

$$s_k(n) = 1^k + 2^k + 3^k + \cdots + n^k$$

one has

$$s_k(n) = \frac{1}{k+1}(B_{k+1}(n) - B_{k+1}(0)).$$

Proof. By Exercise VII.1.3,

$$x^k = \frac{1}{k+1}(B_{k+1}(x) - B_{k+1}(x-1)).$$

Hence the telescoping sum is

$$\begin{aligned} s_k(n) &= \sum_{x=1}^n x^k \\ &= \sum_{x=1}^n \frac{1}{k+1}(B_{k+1}(x) - B_{k+1}(x-1)) \\ &= \frac{1}{k+1}(B_{k+1}(n) - B_{k+1}(0)). \end{aligned}$$

□
