**Exercise 5.1.** Let  $f$  be defined for all real  $x$ , and suppose that

$$|f(x) - f(y)| \leq (x - y)^2$$

for all real  $x$  and  $y$ . Prove that  $f$  is a constant.

*Proof.*

(1) Write

$$\left| \frac{f(x) - f(y)}{x - y} \right| \leq |x - y|$$

if  $x \neq y$ .

(2) Given any  $y \in \mathbb{R}$ ,

$$\left| \frac{f(x) - f(y)}{x - y} \right| \rightarrow 0 \quad \text{as } x \rightarrow y,$$

or  $|f'(y)| = 0$ . (Or using  $\varepsilon$ - $\delta$  argument. Fix  $y \in \mathbb{R}$ . Given any  $\varepsilon > 0$ , there exists  $\delta = \varepsilon > 0$  such that

$$\left| \frac{f(x) - f(y)}{x - y} - 0 \right| \leq |x - y| < \delta = \varepsilon$$

whenever  $|x - y| < \delta$ . That is,  $|f'(y)| = 0$ .) So  $f'(y) = 0$  for any  $y \in \mathbb{R}$ . By Theorem 5.11 (b),  $f$  is a constant.

**Exercise 5.3.**

PLACEHOLDER

**Exercise 5.4.** If

$$C_0 + \frac{C_1}{2} + \cdots + \frac{C_{n-1}}{n} + \frac{C_n}{n+1} = 0,$$

where  $C_0, \dots, C_n$  are real constants, prove that the equation

$$C_0 + C_1x + \dots + C_{n-1}x^{n-1} + C_nx^n = 0$$

has at least one real root between 0 and 1.

*Proof.* Let

$$g(x) = C_0x + \frac{C_1}{2}x^2 + \dots + \frac{C_{n-1}}{n}x^n + \frac{C_n}{n+1}x^{n+1} \in \mathbb{R}[x].$$

Then  $g(0) = g(1) = 0$ , and  $g'(x) = C_0 + C_1x + \dots + C_{n-1}x^{n-1} + C_nx^n$ . By the mean value theorem (Theorem 5.10), there exists a point  $\xi \in (0, 1)$  at which

$$g(1) - g(0) = g'(\xi)(1 - 0),$$

or  $g'(\xi) = 0$ . That is, there exists a real root  $x = \xi$  between 0 and 1 at which  $C_0 + C_1x + \dots + C_{n-1}x^{n-1} + C_nx^n = 0$ .  $\square$

**Exercise 5.14.** Let  $f$  be a differentiable real function defined in  $(a, b)$ . Prove that  $f$  is convex if and only if  $f'$  is monotonically increasing. Assume next  $f''(x)$  exists for every  $x \in (a, b)$ , and prove that  $f$  is convex if and only if  $f''(x) \geq 0$  for all  $x \in (a, b)$ .

*Proof.*

(1) Show that  $f'$  is monotonically increasing if  $f$  is convex.

(a) Since  $f$  is convex, by definition (Exercise 4.23)

$$f(\lambda x + (1 - \lambda)y) \leq \lambda f(x) + (1 - \lambda)f(y)$$

whenever  $a < x < b$ ,  $a < y < b$ ,  $0 < \lambda < 1$ .

(b) As  $x \neq y$ , we have

$$\begin{aligned} f(y) - f(x) &\geq \frac{f(x + \lambda(y - x)) - f(x)}{\lambda} \\ &= \frac{f(x + \lambda(y - x)) - f(x)}{\lambda(y - x)} \cdot (y - x) \end{aligned}$$

and let  $\lambda \rightarrow 0$  to get

$$f(y) - f(x) \geq f'(x)(y - x)$$

(since  $f'(x)$  exists). Similarly, we have

$$f(x) - f(y) \geq f'(y)(x - y).$$

(c) Given any  $y > x$ , we have

$$f'(y)(y - x) \geq f(y) - f(x) \geq f'(x)(y - x).$$

Hence  $f'(y) \geq f'(x)$  whenever  $y > x$ , or  $f'$  is monotonically increasing.

(2) *Show that  $f$  is convex if  $f'$  is monotonically increasing.* Given any  $y > x$  and any  $0 < \lambda < 1$ .

(a) By Theorem 5.10 (the mean value theorem), there is a point  $x < \xi < y$  such that

$$f(y) - f(x) = f'(\xi)(y - x).$$

Since  $f'$  is monotonically increasing,

$$f'(y)(y - x) \geq f(y) - f(x) \geq f'(x)(y - x).$$

(b) Write  $z = \lambda x + (1 - \lambda)y$ . Hence

$$\begin{aligned} f(y) - f(z) &\geq f'(z)(y - z), \\ f(z) - f(x) &\leq f'(z)(z - x), \end{aligned}$$

or

$$\begin{aligned} f(y) &\geq f(z) + f'(z)(y - z), \\ f(x) &\geq f(z) + f'(z)(x - z), \end{aligned}$$

or

$$\begin{aligned} \lambda f(x) + (1 - \lambda)f(y) &\geq \lambda[f(z) + f'(z)(x - z)] \\ &\quad + (1 - \lambda)[f(z) + f'(z)(y - z)] \\ &= f(z) \\ &= f(\lambda x + (1 - \lambda)y). \end{aligned}$$

Hence  $f$  is convex.

(3) *Show that  $f''(x) \geq 0$  if  $f$  is convex and  $f''$  exists.* By (1),  $f'$  is monotonically increasing since  $f$  is convex. Given any  $x \neq y$ , we have

$$\frac{f'(y) - f'(x)}{y - x} \geq 0.$$

Let  $y \rightarrow x$ , we have  $f''(x) \geq 0$  if  $f''$  exists.

(4) *Show that  $f$  is convex if  $f''$  exists and  $f''(x) \geq 0$ .* By Theorem 5.11(a),  $f'$  is monotonically increasing. By (2),  $f$  is convex.
