Exercise 2.1. *Prove that the empty set is a subset of every set.*

Proof. By Definitions 1.3,

(1) The set which contains no element will be called the **empty set**,

(2) If A and B are sets, and if every element of A is an element of B, we say that A is a **subset** of B,

every element of the empty set (there are none) belongs to every set. That is, the empty set is a subset of every set. □

Exercise 2.10. *Let X be an infinite set. For $p \in X$ and $q \in X$, define*

$$d(p,q) = \begin{cases} 1 & (\textit{if } p \neq q) \\ 0 & (\textit{if } p = q). \end{cases}$$

Prove that this is a metric. Which subsets of the resulting metric space are open? Which are closed? Which are compact?

(The statement holds even if X is finite.) We called d the discrete metric, and the corresponding topology on X induces the discrete topology. Conversely, if X has the discrete topology, X is always metrizable by the discrete metric.

Proof.

(1) *$d(p,q)$ is a metric.*

  (a) *$d(p,q) > 0$ if $p \neq q$; $d(p,p) = 0$.* Trivial.

  (b) *$d(p,q) = d(q,p)$.* Trivial.

  (c) *$d(p,q) \leq d(p,r) + d(r,q)$ for any $r \in X$.* If $p = q$, nothing to do. If $p \neq q$, $r \neq p$ or $r \neq q$ for any $r \in X$. (Assume not true, $r = p$ and $r = q$ implies that $p = q$ which is a contradiction.) In any cases $d(p,r) + d(r,q) \geq 1 = d(p,q)$.

(2) *Every subset is open.* Let E be any subset of X. Then every point $p \in E$ is an interior point of E. In fact, we can pick one neighborhood $N_{\frac{1}{2}}(p)$ of p containing only one point $p \in E$ or $N_{\frac{1}{2}}(p) = \{p\}$, and such neighborhood $N_{\frac{1}{2}}(p)$ is a subset of E. So every subset of X is open.

(3) *Every subset is closed.* Since every subset is open, every subset is closed by Theorem 2.23.

Supplement. Might use Definition 2.18 (d) to prove directly since there are no limit points in X if we consider one neighborhood $N_{\frac{1}{2}}(p)$ of p. Therefore, every subset is closed. Again we apply Theorem 2.23 to get that every subset is open without using Definition 2.18 (f).

(4) *A subset is compact iff it is finite.*

(a) *Any finite subset is compact.* Say $E = \{p_1, p_2, ..., p_k\}$, and $\{G_\alpha\}$ be an open covering of E. From $\{G_\alpha\}$ we pick G_{α_1} containing p_1, G_{α_2} containing p_2, ..., and G_{α_k} containing p_k. This process can be done in the finitely many steps. Therefore,

$$\{G_{\alpha_1}, G_{\alpha_2}, ..., G_{\alpha_k}\}$$

is a finite subcovering of $\{G_\alpha\}$ covering E.

(b) *Any infinite subset is not compact.* Take a collection

$$\mathscr{G} = \{G_p = \{p\}\}$$

of open subsets where p runs all points in E. Clearly, $\{G_p\}$ is an open covering. Assume

$$\mathscr{G}' = \{G_{p_1}, G_{p_2}, ..., G_{p_k}\}$$

is any finite subcovering of $\mathscr{G}$. Since E is infinite, there exist a point $p \in E$ such that $p \neq p_1$, $p \neq p_2$, ..., $p \neq p_k$. Therefore, $\mathscr{G}'$ does not cover p, or $\mathscr{G}$ does not contains any finite subcovering $\mathscr{G}'$.

□

Notice that every subset is bounded. Therefore, every subset is closed and bounded, but only finite subset is compact, i.e., Heine-Borel theorem is not true in the infinite discrete topology X.

Exercise 2.12. *Let $K \subset \mathbb{R}^1$ consist of 0 and the numbers $\frac{1}{n}$, for $n = 1, 2, 3, ...$. Prove that K is compact directly from the definition (without using the Heine-Borel theorem).*

Proof. Let $\{G_\alpha\}$ be an open covering of K. There is an open set $G_0 \in \{G_\alpha\}$ containing 0. So there exists a neighborhood $N_r(0)$ of 0 such that $N_r(0) \subset G_0$. So $N_r(0)$ contains all points $q = \frac{1}{n}$ of K whenever $n > \frac{1}{r}$. To construct a finite subcovering of $\{G_\alpha\}$, we need to pick finitely many open sets from $\{G_\alpha\}$ to cover the remaining points $q = \frac{1}{n}$ where $n = 1, 2, ..., \left[\frac{1}{r}\right]$, say G_1 contains $q = \frac{1}{1}$, G_2 contains $q = \frac{1}{2}$, ..., $G_{\left[\frac{1}{r}\right]}$ contains $q = \frac{1}{\left[\frac{1}{r}\right]}$. (Might be duplicated.) Hence,

$$\left\{G_0, G_1, G_2, ..., G_{\left[\frac{1}{r}\right]}\right\}$$

is a finite subcovering of $\{G_\alpha\}$ covering K. $\square$

Proof (Heine-Borel theorem).

(1) K is closed. In fact, the only limit point of K is 0, which is in K.

  (a) $p = 0$ *is a limit point.* Given $r > 0$. There always exists $n \in \mathbb{Z}^+$ such that $r > \frac{1}{n}$. So any neighborhood $N_r(0)$ of $p = 0$ contains at least one point $q = \frac{1}{n} \neq 0$ in K.

  (b) $p < 0$ *is not a limit point.* Pick a neighborhood $N_r(p)$ of p where $r = |p| > 0$. Then $N_r(p) \cap K = \varnothing$.

  (c) $p > 0$ *is not a limit point.* There always exists $m \in \mathbb{Z}^+$ such that $p > \frac{1}{n}$ whenever $n \geq m$. Pick a neighborhood $N_r(p)$ of p where $r = p - \frac{1}{m} > 0$. Then $N_r(p)$ does not have all points $q = \frac{1}{n} \in K$ whenever $n \geq m$. By Theorem 2.20, p cannot be a limit point of K.

(2) K is bounded. There is a real number $M = 2$ and a point $q = 0 \in \mathbb{R}^1$ such that $|p - q| = |p| < 2$ for all $p \in K$.

By Heine-Borel theorem, K is compact in $\mathbb{R}^1$. $\square$

Exercise 2.14. *Give an example of an open cover of the segment* $(0, 1)$ *which has no finite subcover.*

Proof. In $\mathbb{R}^1$, take a collection

$$\mathscr{G} = \left\{G_n = \left(\frac{1}{n}, 1\right)\right\}$$

of open subsets where $n \in \mathbb{Z}^+$.

(1) $\mathscr{G}$ *is an open covering of* $(0, 1) \subset \mathbb{R}^1$. Actually, given $x \in (0, 1)$, there exists an positive integer n such that $x > \frac{1}{n}$. That is, $x \in \left(\frac{1}{n}, 1\right) = G_n$.

(2) *There is no finite subcovering of* $\mathscr{G}$. Assume

$$\mathscr{G}' = \{G_{n_1}, G_{n_2}, ..., G_{n_k}\}$$

is any finite subcovering of $\mathscr{G}$ where $n_1 < n_2 < ... < n_k$. Take $x \in \left(0, \frac{1}{n_k}\right) \neq \varnothing$, $x = \frac{1}{2n_k}$ for example. Then $x \notin G_{n_1}$, $x \notin G_{n_1}$, ..., $x \notin G_{n_k}$, which contradicts that $\mathscr{G}'$ is a finite subcovering of $\mathscr{G}$ covering $(0, 1)$.

$\square$
