# Chapter 1: Elliptic functions

**Exercise 1.1.**

*Given two pairs of complex numbers $(\omega_1, \omega_2)$ and $(\omega_1', \omega_2')$ with nonreal ratios $\omega_1/\omega_2$ and $\omega_1'/\omega_2'$. Prove that they generate the same set of periods if, and only if, there is a $2 \times 2$ matrix $\begin{pmatrix} a & b \\ c & d \end{pmatrix}$ with integer entries and determinant $\pm 1$ such that*

$$\begin{pmatrix} \omega_2' \\ \omega_1' \end{pmatrix} = \begin{pmatrix} a & b \\ c & d \end{pmatrix} \begin{pmatrix} \omega_2 \\ \omega_1 \end{pmatrix}.$$

*Proof.*

(1) ($\Longrightarrow$) Suppose $(\omega_1, \omega_2)$ and $(\omega_1', \omega_2')$ generate the same set of periods. In particular, there is a $2 \times 2$ matrix $A := \begin{pmatrix} a & b \\ c & d \end{pmatrix} \in \mathsf{M}_{2\times 2}(\mathbb{Z})$ (resp. $A' := \begin{pmatrix} a' & b' \\ c' & d' \end{pmatrix} \in \mathsf{M}_{2\times 2}(\mathbb{Z})$) such that

$$\begin{pmatrix} \omega_2' \\ \omega_1' \end{pmatrix} = A \begin{pmatrix} \omega_2 \\ \omega_1 \end{pmatrix}, \qquad \begin{pmatrix} \omega_2 \\ \omega_1 \end{pmatrix} = A' \begin{pmatrix} \omega_2' \\ \omega_1' \end{pmatrix}.$$

Hence it suffices to show $\det(A) = \pm 1$.

(2) Note that

$$\begin{pmatrix} \omega_2' \\ \omega_1' \end{pmatrix} = AA' \begin{pmatrix} \omega_2' \\ \omega_1' \end{pmatrix}.$$

Hence

$$AA' = \begin{pmatrix} 1 & 0 \\ 0 & 1 \end{pmatrix}.$$

Take the determinant on the both sides to get

$$\det(A) \det(A') = 1.$$

Since $\det(\mathsf{M}_{2\times 2}(\mathbb{Z})) \subseteq \mathbb{Z}$, $\det(A) = \pm 1$.

(3) ($\Longleftarrow$) $\Omega(\omega_1', \omega_2') \subseteq \Omega(\omega_1, \omega_2)$ is obvious. Note that

$$\begin{pmatrix} \omega_2 \\ \omega_1 \end{pmatrix} = \underbrace{\frac{1}{\det(A)} \begin{pmatrix} d & -b \\ -c & a \end{pmatrix}}_{\in \mathsf{M}_{2\times 2}(\mathbb{Z})} \begin{pmatrix} \omega_2' \\ \omega_1' \end{pmatrix}.$$

Thus $\Omega(\omega_1, \omega_2) \subseteq \Omega(\omega_1', \omega_2')$. Therefore $\Omega(\omega_1, \omega_2) = \Omega(\omega_1', \omega_2')$.

$\square$

**Supplement 1.1.1.**

(Exercise I.1.1 in the textbook: *Jörgen Neukirch, Algebraic Number Theory.*)
$\alpha \in \mathbb{Z}[i]$ *is a unit if and only if* $N(\alpha) = 1$.

*Proof.*

(1) ($\Longrightarrow$) Since $\alpha$ is a unit, there is $\beta \in \mathbb{Z}[i]$ such that $\alpha\beta = 1$. So $N(\alpha\beta) = N(1)$, or $N(\alpha)N(\beta) = 1$. Since the image of $N$ is nonnegative integers, $N(\alpha) = 1$.

(2) ($\Longleftarrow$) $N(\alpha) = \alpha\overline{\alpha}$, or $1 = \alpha\overline{\alpha}$ since $N(\alpha) = 1$. That is, $\overline{\alpha} \in \mathbb{Z}[i]$ is the inverse of $\alpha \in \mathbb{Z}[i]$. (Or we solve the equation $N(\alpha) = a^2 + b^2 = 1$, and show that all four solutions ($\pm 1$ and $\pm i$) are units.)

(3) Conclusion: a unit $\alpha = a + bi$ of $\mathbb{Z}[i]$ is satisfying the equation $N(\alpha) = a^2 + b^2 = 1$ by (1)(2). That is, the only unit of $\mathbb{Z}[i]$ are $\pm 1$ and $\pm i$.

$\square$

**Exercise 1.2.**

*Let $S(0)$ denote the sum of the zeros of an elliptic function $f$ in a period parallelogram, and let $S(\infty)$ denote the sum of the poles in the same parallelogram. Prove that $S(0) - S(\infty)$ is a period of $f$. (Hint: Integrate $z\frac{f'(z)}{f(z)}$.)*

*Proof.*

(1) Similar to Theorem 1.8, the integral

$$\frac{1}{2\pi i} \int_C z\frac{f'(z)}{f(z)}$$

taken around the boundary $C$ of a cell (no zeros or poles on its boundary) counts the difference between the sum of the zeros and the sum of the poles inside the cell, that is,

$$S(0) - S(\infty) = \frac{1}{2\pi i} \int_C z\frac{f'(z)}{f(z)}.$$

(The proof is similar to the proof of the argument principle.)

(2) Let $C_1$ be the path from 0 to $\omega_1$, $C_2$ be the path from $\omega_1$ to $\omega_1 + \omega_2$, $C_3$

3

be the path from $\omega_1 + \omega_2$ to $\omega_2$, and $C_4$ be the path from $\omega_2$ to $0$. Hence

$$\frac{1}{2\pi i} \int_{C_1} z \frac{f'(z)}{f(z)} + \frac{1}{2\pi i} \int_{C_3} z \frac{f'(z)}{f(z)}$$

$$= \frac{1}{2\pi i} \int_{C_1} z \frac{f'(z)}{f(z)} + \frac{1}{2\pi i} \int_{-C_1} (z + \omega_2) \frac{f'(z + \omega_2)}{f(z + \omega_2)}$$

$$= \frac{1}{2\pi i} \int_{C_1} z \frac{f'(z)}{f(z)} - \frac{1}{2\pi i} \int_{C_1} (z + \omega_2) \frac{f'(z)}{f(z)}$$

$$= -\omega_2 \frac{1}{2\pi i} \int_{C_1} \frac{f'(z)}{f(z)}$$

and

$$\frac{1}{2\pi i} \int_{C_2} z \frac{f'(z)}{f(z)} + \frac{1}{2\pi i} \int_{C_4} z \frac{f'(z)}{f(z)}$$

$$= \frac{1}{2\pi i} \int_{-C_4} (z + \omega_1) \frac{f'(z + \omega_1)}{f(z + \omega_1)} + \frac{1}{2\pi i} \int_{C_4} z \frac{f'(z)}{f(z)}$$

$$= -\frac{1}{2\pi i} \int_{C_4} (z + \omega_1) \frac{f'(z)}{f(z)} + \frac{1}{2\pi i} \int_{C_4} z \frac{f'(z)}{f(z)}$$

$$= -\omega_1 \frac{1}{2\pi i} \int_{C_4} \frac{f'(z)}{f(z)}$$

Therefore

$$S(0) - S(\infty) = -\omega_1 \frac{1}{2\pi i} \int_{C_4} \frac{f'(z)}{f(z)} - \omega_2 \frac{1}{2\pi i} \int_{C_1} \frac{f'(z)}{f(z)}.$$

So it suffices to show that $\frac{1}{2\pi i} \int_{C_1} \frac{f'(z)}{f(z)} \in \mathbb{Z}$. (Other cases are similar.)

(3) By choosing one branch of log, we have

$$\frac{1}{2\pi i} \int_{C_1} \frac{f'(z)}{f(z)} = \frac{1}{2\pi i} \log \frac{f(\omega_1)}{f(0)}$$

$$= \frac{1}{2\pi i} \log(1) \qquad\qquad (f(\omega_1) = f(0))$$

$$= \frac{1}{2\pi i}(2\pi i m) \text{ for some } m \in \mathbb{Z}$$

$$= m \in \mathbb{Z}.$$

$\square$

**Exercise 1.3.**

(a) *Prove that $\wp(u) = \wp(v)$ if, and only if, $u - v$ or $u + v$ is a period of $\wp$.*

4

(b) *Let $a_1, \ldots, a_n$ and $b_1, \ldots, b_m$ be complex numbers such that none of the numbers $\wp(a_i) - \wp(b_j)$ is zero. Let*

$$f(z) = \frac{\prod_{k=1}^{n}[\wp(z) - \wp(a_k)]}{\prod_{r=1}^{m}[\wp(z) - \wp(b_r)]}.$$

*Prove that $f$ is an even elliptic function with zeros at $a_1, \ldots, a_n$ and poles at $b_1, \ldots, b_m$.*

*Proof of (a).*

(1) Let $\Omega$ be the lattice generated by periods of $\wp$.

(2) ($\Longrightarrow$) It is equivalent to show that the equation $\wp(u) = \wp(v)$ in terms of $u$ has exactly two roots in some period parallelogram. $u \equiv v \pmod{\Omega}$ is a root clearly and $u \equiv -v \pmod{\Omega}$ is also a root since $\wp$ is even. Since $\wp$ is an elliptic function of order 2 (Theorem 1.8), $u \equiv \pm v \pmod{\Omega}$ is the only two roots of $\wp(u) = \wp(v)$.

(3) ($\Longleftarrow$) Obvious.

$\square$

*Proof of (b).*

(1) Since $\wp$ is an even elliptic function, $f$ is an even elliptic function too.

(2) $f$ has zeros at $a_1, \ldots, a_n$ and poles at $b_1, \ldots, b_m$ (by construction and (a)).

$\square$

**Exercise 1.4.**

*Prove that every even elliptic function $f$ is a rational function of $\wp$, where periods of $\wp$ are a subset of the periods of $f$.*

*Proof.*

(1) Nothing to do if $f$ is constant. Let $C$ be one period parallelogram of $f$ and $\wp$. Let $\Omega(\omega_1, \omega_2)$ be the lattice generated by periods of $\wp$. Suppose $f$ has zeros at $a_1, \ldots, a_n$ and poles at $b_1, \ldots, b_m$.

(2) Might assume that $\wp(z) - \wp(a_k)$ (resp. $\wp(z) - \wp(b_r)$) has a simple zero in $a_k$ (resp. $b_r$) for all $k, r$. So the function

$$g(z) := f(z) \cdot \frac{\prod_{r=1}^{m}[\wp(z) - \wp(b_r)]^{\beta_r}}{\prod_{k=1}^{n}[\wp(z) - \wp(a_k)]^{\alpha_k}}$$

5

is an elliptic function with no zeros or poles in $C$ where $\alpha_k$ (resp. $\beta_r$) is the order of the zero $a_k$ (resp. the pole $b_r$). By Theorems 1.4 and 1.5, $g(z)$ is a constant. Hence

$$f(z) = C \cdot \frac{\prod_{k=1}^{n}[\wp(z) - \wp(a_k)]^{\alpha_k}}{\prod_{r=1}^{m}[\wp(z) - \wp(b_r)]^{\beta_r}}$$

for some constant $C \in \mathbb{C}$.

(3) Now we consider the case $a_k$ (resp. $b_r$) is a zero of $\wp'(z)$. Since $f$ is an even elliptic function, the order of $a_k$ (resp. $b_r$) of $f$ is even. Note that the order of $a_k$ (resp. $b_r$) of $\wp(z) - \wp(a_k)$ (resp. $\wp(z) - \wp(b_r)$) is 2. Hence the function

$$g(z) := f(z) \cdot \frac{\prod_{\wp'(b_r) \neq 0}[\wp(z) - \wp(b_r)]^{\beta_r}}{\prod_{\wp'(a_k) \neq 0}[\wp(z) - \wp(a_k)]^{\alpha_k}} \cdot \frac{\prod_{\wp'(b_r) = 0}[\wp(z) - \wp(b_r)]^{\frac{\beta_r}{2}}}{\prod_{\wp'(a_k) = 0}[\wp(z) - \wp(a_k)]^{\frac{\alpha_k}{2}}}$$

is a constant too.

$\square$

### Supplement 1.4.1. (Divisor class group)

(Problem 8.6 in the textbook: *William Fulton, Algebraic Curves.*) *Let $D(X)$ be the group of divisors on $X$, $D_0(X)$ the subgroup consisting of divisors of degree zero, and $P(X)$ the subgroup of $D_0(X)$ consisting of divisors of rational functions. Let $C_0(X) = D_0(X)/P(X)$ be the quotient group. It is the **divisor class group** on $X$.*

  (a) *If $X = \mathbf{P}^1$, then $C_0(X) = 0$.*

  (b) *Let $X = C$ be a nonsingular cubic. Pick $P_0 \in C$, defining $\oplus$ on $C$. Show that the map from $C$ to $C_0(X)$ that sends $P$ to the residue class of the divisor $P - P_0$ is an isomorphism from $(C, \oplus)$ onto $C_0(X)$.*

*Proof of (a).*

  (1) Given a divisor

$$D = \sum_{P \in X} n_P P \in D_0(X)$$

where $n_P \in \mathbb{Z}$ and $\sum_P n_P = 0$.

  (2) Note that $\sum_P n_P = 0$. We can define a rational function $z \in k(X)$ by

$$z = \prod_{P = [a_P : b_P] \in X} (b_P x - a_P y)^{n_P}.$$

Hence $\operatorname{div}(z) = D \in P(X)$. Therefore $C_0(X) = D_0(X)/P(X) = 0$.

□

*Proof of (b).*

(1) Define $\alpha : (C, \oplus) \to C_0(X)$ by $P \mapsto [P - P_0]$.

(2) *Show that $\alpha$ is a group homomorphism.* If $P \oplus Q = R$, then

$$
\begin{aligned}
P \oplus Q &= R \\
\Longleftrightarrow [P + Q] &= [R + P_0] & \text{(Problem 8.3(c))} \\
\Longleftrightarrow [P - P_0] + [Q - P_0] &= [R - P_0] & \text{(Proposition 2)} \\
\Longleftrightarrow \alpha(P) + \alpha(Q) &= \alpha(R) = \alpha(P \oplus Q).
\end{aligned}
$$

(3) *Show that $\alpha$ is injective.*

$$
\begin{aligned}
\alpha(P) = 0 \Longleftrightarrow [P - P_0] &= 0 \\
\Longleftrightarrow [P] &= [P_0] & \text{(Proposition 2)} \\
\Longleftrightarrow P &= P_0. & \text{(Problem 8.3(a))}
\end{aligned}
$$

(4) *Show that $\alpha$ is surjective.* Given $[D] \in C_0(X)$ and we want to find a point $P \in C$ such that $\alpha(P) = [D]$. Write

$$
D = (P_1 + \cdots + P_r) - (Q_1 + \cdots + Q_r)
$$

for some $P_i, Q_i \in C$. So

$$
\begin{aligned}
[D] &= [P_1 - P_0] + \cdots + [P_r - P_0] - [Q_1 - P_0] - \cdots - [Q_r - P_0] \\
&= \alpha(P_1) + \cdots + \alpha(P_r) - \alpha(Q_1) - \cdots - \alpha(Q_r) \\
&= \alpha(P_1) + \cdots + \alpha(P_r) + \alpha(Q_1') + \cdots + \alpha(Q_r') \\
&= \alpha(P_1 \oplus \cdots \oplus P_r \oplus Q_1' \oplus \cdots \oplus Q_r').
\end{aligned}
$$

where $Q_i'$ is the inverse of $Q_i$ in $(C, \oplus)$. Hence there is a point $P := P_1 \oplus \cdots \oplus P_r \oplus Q_1' \oplus \cdots \oplus Q_r' \in C$ such that $\alpha(P) = [D]$.

□

**Exercise 1.5.**

*Prove that every elliptic function $f$ can be expressed in the form*

$$
f(z) = R_1[\wp(z)] + \wp'(z) R_2[\wp(z)]
$$

*where $R_1$ and $R_2$ are rational functions and $\wp$ has the same set of periods as $f$.*

*Proof.*

$$f(z) = \underbrace{\frac{f(z) + f(-z)}{2}}_{\text{even}} + \wp'(z) \underbrace{\frac{f(z) - f(-z)}{2\wp'(z)}}_{\text{even}}$$

$$= R_1[\wp(z)] + \wp'(z)R_2[\wp(z)] \text{ for some rational functions } R_1, R_2$$

(by Exercise 1.4). $\square$

**Exercise 1.6.**

*Let $f$ and $g$ be two elliptic functions with the same set of periods. Prove that there exists a polynomial $P(x, y)$, not identically zero, such that*

$$P[f(z), g(z)] = C$$

*where $C$ is a constant (depending on $f$ and $g$ but not on $z$).*

*Proof.*

(1) By Exercise 1.5, we have

$$f(z) = R_1[\wp(z)] + \wp'(z)R_2[\wp(z)]$$

for some rational functions $R_1, R_2$ and $\wp$ has the same set of periods as $f$. By cleaning the denominators of $R_1$ and $R_2$, we might assume

$$S[\wp(z)]f(z) = R_1[\wp(z)] + \wp'(z)R_2[\wp(z)]$$

for some polynomials $R_1, R_2, S$.

(2) So

$$\wp'(z)R_2[\wp(z)] = S[\wp(z)]f(z) - R_1[\wp(z)]$$
$$\implies \wp'(z)^2 R_2[\wp(z)]^2 = (S[\wp(z)]f(z) - R_1[\wp(z)])^2$$
$$\implies (4\wp(z)^3 - 60G_4\wp(z) - 140G_6)R_2[\wp(z)]^2$$
$$= (S[\wp(z)]f(z) - R_1[\wp(z)])^2. \qquad \text{(Theorem 1.12)}$$
$$\implies F(\wp(z), f(z)) = 0$$

for some polynomials $F(x, y) \in \mathbb{C}[x, y]$. Note that $F(x, y)$ is of degree 2 if we view $F \in (\mathbb{C}[x])[y]$.

(3) Similarly,
$$G(\wp(z), g(z)) = 0$$

for some polynomials $G(x, y) \in \mathbb{C}[x, y]$.

8

(4) Let $P = \text{Res}_x(F, G)$ be the resultant of two polynomials $F$ and $G$ with respect t $x$ to eliminate $\wp(z)$. Note that $P$ is a nonzero polynomial (since $F$ and $G$ are nonzero) and $P[f(z), g(z)] = 0$. So $P$ is our desired polynomial.

□

### Exercise 1.7.

*The discriminant of the polynomial $f(x) = 4(x - x_1)(x - x_2)(x - x_3)$ is the product $16\{(x_2 - x_1)(x_3 - x_2)(x_3 - x_1)\}^2$. Prove that the discriminant of $f(x) = 4x^3 - ax - b$ is $a^3 - 27b^2$.*

*Proof.*

(1) Since
$$f'(x) = 4(x - x_2)(x - x_3) + 4(x - x_1)(x - x_3) + 4(x - x_1)(x - x_2),$$
we have
$$f'(x_1) = 4(x_1 - x_2)(x_1 - x_3),$$
$$f'(x_2) = 4(x_2 - x_1)(x_2 - x_3),$$
$$f'(x_3) = 4(x_3 - x_1)(x_3 - x_2).$$
Hence
$$f'(x_1)f'(x_2)f'(x_3) = -4\text{disc}(f)$$
where $\text{disc}(f)$ is the discriminant of $f(x)$.

(2) As $f(x) = 4x^3 - ax - b$, we have $f'(x) = 12x^2 - a$. So
$$f'(x_1)f'(x_2)f'(x_3) = (12x_1^2 - a)(12x_2^2 - a)(12x_3^2 - a).$$
Note that
$$x_1 x_2 x_3 = \frac{b}{4},$$
$$x_1 x_2 + x_2 x_3 + x_3 x_1 = -\frac{a}{4},$$
$$x_1 + x_2 + x_3 = 0,$$
we have
$$x_1^2 x_2^2 x_3^2 = \frac{b^2}{4^2},$$
$$x_1^2 x_2^2 + x_2^2 x_3^2 + x_3^2 x_1^2 = (x_1 x_2 + x_2 x_3 + x_3 x_1)^2 - 2x_1 x_2 x_3(x_1 + x_2 + x_3)$$
$$= \frac{a^2}{4^2},$$
$$x_1^2 + x_2^2 + x_3^2 = (x_1 + x_2 + x_3)^2 - 2(x_1 x_2 + x_2 x_3 + x_3 x_1)$$
$$= \frac{a}{2}.$$

9

(3) Hence

$$f'(x_1)f'(x_2)f'(x_3) = (12x_1^2 - a)(12x_2^2 - a)(12x_3^2 - a)$$
$$= 12^3(x_1^2 x_2^2 x_3^2) - 12^2 a(x_1^2 x_2^2 + x_2^2 x_3^2 + x_3^2 x_1^2)$$
$$+ 12a^2(x_1^2 + x_2^2 + x_3^2) - a^3$$
$$= 12^3 \cdot \frac{b^2}{4^2} - 12^2 a \cdot \frac{a^2}{4^2} + 12a^2 \cdot \frac{a}{2} - a^3$$
$$= -4(a^3 - 27b^2).$$

Therefore

$$\mathrm{disc}(4x^3 - ax - b) = a^3 - 27b^2.$$

□

**Exercise 1.8.**

*The differential equation for $\wp$ shows that $\wp'(z) = 0$ if $z = \frac{\omega_1}{2}, \frac{\omega_2}{2}$ or $\frac{\omega_1 + \omega_2}{2}$.*
*Show that*

$$\wp''\left(\frac{\omega_1}{2}\right) = 2(e_1 - e_2)(e_1 - e_3)$$

*and obtain corresponding formulas for $\wp''\left(\frac{\omega_2}{2}\right)$ and $\wp''\left(\frac{\omega_1 + \omega_2}{2}\right)$.*

*Proof.*

(1) Differentiation of the equation

$$4\wp(z)^3 - g_2 \wp(z) - g_3 = 4(\wp(z) - e_1)(\wp(z) - e_2)(\wp(z) - e_3)$$

in Theorem 1.14 to get

$$12\wp(z)^2 \wp'(z) - g_2 \wp'(z) = 4\wp'(z)(\wp(z) - e_2)(\wp(z) - e_3)$$
$$+ 4\wp'(z)(\wp(z) - e_1)(\wp(z) - e_3)$$
$$+ 4\wp'(z)(\wp(z) - e_1)(\wp(z) - e_2).$$

Since $\wp''(z) = 6\wp(z)^2 - \frac{g_2}{2}$, we have

$$\wp''(z) = 2(\wp(z) - e_2)(\wp(z) - e_3)$$
$$+ 2(\wp(z) - e_1)(\wp(z) - e_3)$$
$$+ 2(\wp(z) - e_1)(\wp(z) - e_2).$$

(2) Hence

$$\wp''\left(\frac{\omega_1}{2}\right) = 2(e_1 - e_2)(e_1 - e_3),$$
$$\wp''\left(\frac{\omega_2}{2}\right) = 2(e_2 - e_1)(e_2 - e_3),$$
$$\wp''\left(\frac{\omega_1 + \omega_2}{2}\right) = 2(e_3 - e_1)(e_3 - e_2).$$

10

$\square$

**Exercise 1.9.**

*According to Exercise 1.4, the function $\wp(2z)$ is a rational function of $\wp(z)$. Prove that, in fact,*

$$\wp(2z) = \frac{\{\wp(z)^2 + \frac{1}{4}g_2\}^2 + 2g_3\wp(z)}{4\wp(z)^3 - g_2\wp(z) - g_3} = -2\wp(z) + \frac{1}{4}\left(\frac{\wp''(z)}{\wp'(z)}\right)^2.$$

*Proof.*

(1) By $\wp'(z)^2 = 4\wp(z)^3 - g_2\wp(z) - g_3$ and $\wp''(z) = 6\wp(z)^2 - \frac{1}{2}g_2$, we have

$$- 2\wp(z) + \frac{1}{4}\left(\frac{\wp''(z)}{\wp'(z)}\right)^2$$

$$= - 2\wp(z) + \frac{1}{4} \cdot \frac{(6\wp(z)^2 - \frac{1}{2}g_2)^2}{4\wp(z)^3 - g_2\wp(z) - g_3}$$

$$= \frac{-2\wp(z)[4\wp(z)^3 - g_2\wp(z) - g_3] + \frac{1}{4}(6\wp(z)^2 - \frac{1}{2}g_2)^2}{4\wp(z)^3 - g_2\wp(z) - g_3}$$

$$= \frac{\wp(z)^4 + \frac{1}{2}g_2\wp(z)^2 + \frac{1}{16}g_2^2 + 2g_3\wp(z)}{4\wp(z)^3 - g_2\wp(z) - g_3}$$

$$= \frac{\{\wp(z)^2 + \frac{1}{4}g_2\}^2 + 2g_3\wp(z)}{4\wp(z)^3 - g_2\wp(z) - g_3}.$$

So it suffices to show that $\wp(2z) = -2\wp(z) + \frac{1}{4}\left(\frac{\wp''(z)}{\wp'(z)}\right)^2$.

(2) Let $\Omega$ be the lattice generated by periods of $\wp$. Suppose the addition theorem of $\wp$ holds, that is,

$$\wp(u) + \wp(v) + \wp(u + v) = \frac{1}{4}\left(\frac{\wp'(u) - \wp'(v)}{\wp(u) - \wp(v)}\right)^2$$

with $u, v, u + v \not\equiv 0 \pmod{\Omega}$. Then letting $v$ to $u$, we have

$$\wp(2u) = \lim_{v \to u} \wp(u + v)$$

$$= \lim_{v \to u}\left\{-\wp(u) - \wp(v) + \frac{1}{4}\left(\frac{\wp'(u) - \wp'(v)}{\wp(u) - \wp(v)}\right)^2\right\}$$

$$= -2\wp(u) + \frac{1}{4}\lim_{v \to u}\frac{\wp'(v) - \wp'(u)}{\wp(v) - \wp(u)}$$

$$= -2\wp(u) + \frac{1}{4}\left(\frac{\wp''(u)}{\wp'(u)}\right)^2.$$

11

The last equality is followed by L'Hospital's rule. So it suffices to show the addition theorem of $\wp$ is true.

(3) *Let $u + v + w = 0$, with $u, v, w \not\equiv 0 \pmod{\Omega}$. Show that*

$$\begin{vmatrix} \wp(u) & \wp'(u) & 1 \\ \wp(v) & \wp'(v) & 1 \\ \wp(w) & \wp'(w) & 1 \end{vmatrix} = 0.$$

Consider the elliptic function

$$f(z) := \wp'(z) - \underbrace{\frac{\wp'(u) - \wp'(v)}{\wp(u) - \wp(v)}}_{:=A} \wp(z) - \underbrace{\frac{\wp(u)\wp'(v) - \wp(v)\wp'(u)}{\wp(u) - \wp(v)}}_{:=B}.$$

$f$ has exactly 3 zeros in a period parallelogram as $f$ has order 3. Note that $f$ has a pole at 0 of order 3. By Exercise 1.2, the sum of the zeros is equal to the sum of poles in a period parallelogram. Since $u$ and $v$ are zeros of $f$ (by verifying $f(u) = f(v) = 0$ directly), the third zero must be $-u - v = w$. Hence there is a line

$$y = Ax + B$$

passing through 3 points $(\wp(u), \wp'(u))$, $(\wp(v), \wp'(v))$ and $(\wp(w), \wp'(w))$. So the determinant is zero.

(4) Now we are going to remove the term $\wp'(w)$ to prove the addition theorem of $\wp$. By Theorem 1.12, we have the system of equations

$$\begin{cases} y = Ax + B, \\ y^2 = 4x^3 - g_2 x - g_3, \end{cases}$$

where $(x, y) = (\wp(z), \wp'(z))$. Hence

$$(Ax + B)^2 = 4x^3 - g_2 x - g_3$$
$$\Longleftrightarrow 4x^3 - A^2 x^2 - (2AB + g_2)x - (B^2 + g_3) = 0$$
$$\Longrightarrow \text{sum of three roots of } x \text{ is } \frac{A^2}{4}$$
$$\Longrightarrow \wp(u) + \wp(v) + \wp(w) = \frac{1}{4}\left(\frac{\wp'(u) - \wp'(v)}{\wp(u) - \wp(v)}\right)^2$$
$$\Longrightarrow \wp(-u - v) = -\wp(u) - \wp(v) + \frac{1}{4}\left(\frac{\wp'(u) - \wp'(v)}{\wp(u) - \wp(v)}\right)^2$$
$$\Longrightarrow \wp(u + v) = -\wp(u) - \wp(v) + \frac{1}{4}\left(\frac{\wp'(u) - \wp'(v)}{\wp(u) - \wp(v)}\right)^2. \qquad (\wp\text{: even})$$

So the addition theorem of $\wp$ is established.

12

□

*Note.*

(1) In the proof, part (4) is similar to defining an addition $\oplus$ on a nonsingular cubic $E$ in $\mathbf{P}^2(k)$. It is equivalent to defining the divisor class group on $E$. See Problem 8.6 in the textbook: *William Fulton, Algebraic Curves.*

(2) If $E \in \mathbf{P}^2(\mathbb{C})$ is the elliptic curve corresponding to the lattice $\Omega$, then there is an isomorphism

$$\alpha : \mathbb{C}/\Omega \longrightarrow E : y^2 z = 4x^3 - g_2 x z^2 - g_3 z^3$$

defined by

$$\alpha(z) = \begin{cases} [\wp(z) : \wp'(z) : 1] & \text{if } z \neq 0 \in \Omega, \\ [0 : 1 : 0] & \text{if } z = 0 \in \Omega, \end{cases}$$

such that $\alpha$ is both analytic (as a mapping of complex manifolds) and algebraic (as a homomorphism of groups).

**Exercise 1.10.**

*Let $\omega_1$ and $\omega_2$ be complex numbers with nonreal ratio. Let $f(z)$ be an entire function and assume there are constants $a$ and $b$ such that*

$$f(z + \omega_1) = af(z), \qquad f(z + \omega_2) = bf(z),$$

*for all $z$. Prove that $f(z) = Ae^{Bz}$, where $A$ and $B$ are constant.*

*Proof.*

(1) Might assume that $a \neq 0$ and $b \neq 0$ (otherwise $f = 0$ on $\mathbb{C}$).

(2) Define

$$g(z) := \frac{f(z)}{e^{Bz}}.$$

It suffices to show $g$ is a constant. Note that $g(z)$ is entire (since $f$ and $e^{Bz} \neq 0$ are entire). By Theorem 1.4, it suffices to show $g$ is doubly periodic, that is, to show

$$g(z + \omega_1) = g(z) \text{ and } g(z + \omega_2) = g(z)$$

for suitable $B$.

13

(3) Note that

$$g(z + \omega_1) = g(z) \text{ and } g(z + \omega_2) = g(z)$$

$$\Longleftrightarrow \frac{a}{e^{B\omega_1}} \cdot g(z) = g(z) \text{ and } \frac{b}{e^{B\omega_2}} \cdot g(z) = g(z)$$

$$\Longleftrightarrow e^{B\omega_1} = a \text{ and } e^{B\omega_2} = b$$

$$\Longleftrightarrow \exists\, B \text{ such that } e^{B\omega_1} = a \text{ and } e^{B\omega_2} = b.$$

Take $B$ such that $e^{B(\omega_1 - \omega_2)} = \frac{a}{b}$ (since $\frac{a}{b}$ is well-defined, $\omega_1 - \omega_2 \neq 0$, and $z \mapsto \exp(z)$ is a onto map from $\mathbb{C}$ to $\mathbb{C} \smallsetminus \{0\}$). Hence $g$ is doubly periodic.

$\square$

**Exercise 1.11.**

*If $k \geq 2$ and $\tau \in H$ prove that the Eisenstein series*

$$G_{2k}(\tau) = \sum_{(m,n) \neq (0,0)} (m + n\tau)^{-2k}$$

*has the Fourier expansion*

$$G_{2k}(\tau) = 2\zeta(2k) + \frac{2(2\pi i)^{2k}}{(2k - 1)!} \sum_{n=1}^{\infty} \sigma_{2k-1}(n) e^{2\pi i n \tau}.$$

*Proof.*

(1) Let $q = e^{2\pi i \tau}$. Similar to Lemma 1.3 on page 19, we have

$$(2k - 1)! \sum_{m=-\infty}^{+\infty} \frac{1}{(\tau + m)^{2k}} = (2\pi i)^{2k} \sum_{r=1}^{\infty} r^{2k-1} q^r.$$

14

(2) Similar to Theorem 1.18, we have

$$G_{2k}(\tau) = \sum_{(m,n)\neq(0,0)} (m+n\tau)^{-2k}$$

$$= \sum_{\substack{m=-\infty \\ m\neq 0 (n=0)}}^{+\infty} m^{-2k} + \sum_{n=1}^{\infty} \sum_{m=-\infty}^{+\infty} ((m+n\tau)^{-2k} + (m-n\tau)^{-2k})$$

$$= 2\zeta(2k) + 2 \sum_{n=1}^{\infty} \sum_{m=-\infty}^{+\infty} (m+n\tau)^{-2k}$$

$$= 2\zeta(2k) + 2 \sum_{n=1}^{\infty} \frac{(2\pi i)^{2k}}{(2k-1)!} \sum_{r=1}^{\infty} r^{2k-1} q^{nr}$$

$$= 2\zeta(2k) + \frac{2(2\pi i)^{2k}}{(2k-1)!} \sum_{n=1}^{\infty} \underbrace{\sum_{d|n} d^{2k-1}}_{=\sigma_{2k-1}(n)} q^{n}.$$

In the last double sum we collect together those terms for which $nr$ is constant.

□

**Exercise 1.12.**

*Refer to Exercise 1.11. If $\tau \in H$ prove that*

$$G_{2k}\left(-\frac{1}{\tau}\right) = \tau^{2k} G_{2k}(\tau)$$

*and deduce that*

$$G_{2k}\left(\frac{i}{2}\right) = (-4)^{k} G_{2k}(2i) \qquad\qquad \text{for all } k \geq 2,$$
$$G_{2k}(i) = 0 \qquad\qquad \text{if } k \text{ is odd,}$$
$$G_{2k}(e^{\frac{2\pi i}{3}}) = 0 \qquad\qquad \text{if } k \not\equiv 0 \pmod{3}.$$

*Proof.*

15

(1)

$$G_{2k}\left(-\frac{1}{\tau}\right) = \sum_{(m,n)\neq(0,0)} \left(m - \frac{n}{\tau}\right)^{-2k}$$

$$= \tau^{2k} \sum_{(m,n)\neq(0,0)} (\tau m - n)^{-2k}$$

$$= \tau^{2k} G_{2k}(\tau).$$

(2) Let $\tau = 2i$. We have $G_{2k}\left(\frac{i}{2}\right) = (-4)^k G_{2k}(2i)$.

(3) Let $\tau = i$. We have $G_{2k}(i) = (-1)^k G_{2k}(i)$. Hence $G_{2k}(i) = 0$ if $k$ is odd.

(4) Let $\tau = e^{\frac{\pi i}{3}}$. We have $G_{2k}(e^{\frac{2\pi i}{3}}) = e^{\frac{2k\pi i}{3}} G_{2k}(e^{\frac{\pi i}{3}})$. Since

$$e^{\frac{2\pi i}{3}} = -1 + e^{\frac{\pi i}{3}}$$

and each Eisenstein series is a periodic function of $\tau$ of period 1, we have $G_{2k}(e^{\frac{2\pi i}{3}}) = G_{2k}(e^{\frac{\pi i}{3}})$. So $G_{2k}(e^{\frac{2\pi i}{3}}) = e^{\frac{2k\pi i}{3}} G_{2k}(e^{\frac{2\pi i}{3}})$. Therefore $G_{2k}(e^{\frac{2\pi i}{3}}) = 0$ if $k \not\equiv 0 \pmod 3$.

□

**Exercise 1.13.**

*Ramanujan's tau function $\tau(n)$ is defined by the Fourier expansion*

$$\Delta(\tau) = (2\pi)^{12} \sum_{n=1}^{\infty} \tau(n) e^{2\pi i n \tau},$$

*derived in Theorem 1.19. Prove that*

$$\tau(n) = 8000\{(\sigma_3 \circ \sigma_3) \circ \sigma_3\}(n) - 147(\sigma_5 \circ \sigma_5)(n),$$

*where $f \circ g$ denotes the Cauchy product of two sequences,*

$$(f \circ g)(n) = \sum_{k=0}^{n} f(k)g(n-k),$$

*and $\sigma_\alpha(n) = \sum_{d|n} d^\alpha$ for $n \geq 1$, with $\sigma_3(0) = \frac{1}{240}$, $\sigma_5(0) = -\frac{1}{504}$. (Hint: Theorem 1.18.)*

*Proof.*

16

(1) Let $q = e^{2\pi i \tau}$. Write

$$g_2(\tau) = \frac{4\pi^4}{3} \left\{ 1 + 240 \sum_{k=1}^{\infty} \sigma_3(k)q^k \right\} = \frac{4\pi^4}{3} \left\{ 240 \sum_{k=0}^{\infty} \sigma_3(k)q^k \right\},$$

$$g_3(\tau) = \frac{8\pi^6}{27} \left\{ 1 - 504 \sum_{k=1}^{\infty} \sigma_5(k)q^k \right\} = \frac{8\pi^6}{27} \left\{ -504 \sum_{k=0}^{\infty} \sigma_5(k)q^k \right\}$$

(Theorem 1.18).

(2) Similar to the proof of Theorem 1.19,

$$\Delta(\tau) = g_2(\tau)^3 - 27 g_3(\tau)^2$$

$$= \frac{64\pi^{12}}{27} \left\{ \left( 240 \sum_{k=0}^{\infty} \sigma_3(k)q^k \right)^3 - \left( -504 \sum_{k=0}^{\infty} \sigma_5(k)q^k \right)^2 \right\}$$

$$= (2\pi)^{12} \left\{ 8000 \left( \sum_{k=0}^{\infty} \sigma_3(k)q^k \right)^3 - 147 \left( \sum_{k=0}^{\infty} \sigma_5(k)q^k \right)^2 \right\}$$

$$= (2\pi)^{12} \sum_{n=0}^{\infty} \left\{ 8000\{(\sigma_3 \circ \sigma_3) \circ \sigma_3\}(n) - 147(\sigma_5 \circ \sigma_5)(n) \right\} q^n$$

$$= (2\pi)^{12} \sum_{n=1}^{\infty} \left\{ 8000\{(\sigma_3 \circ \sigma_3) \circ \sigma_3\}(n) - 147(\sigma_5 \circ \sigma_5)(n) \right\} q^n.$$

(Here $8000\{(\sigma_3 \circ \sigma_3) \circ \sigma_3\}(0) - 147(\sigma_5 \circ \sigma_5)(0) = 0$.)

(3) Therefore

$$\tau(n) = 8000\{(\sigma_3 \circ \sigma_3) \circ \sigma_3\}(n) - 147(\sigma_5 \circ \sigma_5)(n)$$

for $n \geq 1$.

$\square$

**Exercise 1.14. (Lambert series)**

*A series of the form $\sum_{n=1}^{\infty} f(n)\frac{x^n}{1-x^n}$ is called a **Lambert series**. Assuming absolute convergence, prove that*

$$\sum_{n=1}^{\infty} f(n)\frac{x^n}{1-x^n} = \sum_{n=1}^{\infty} F(n)x^n,$$

*where*

$$F(n) = \sum_{d|n} f(d).$$

*Apply this result to obtain the following formulas, valid for $|x| < 1$.*

(a)
$$\sum_{n=1}^{\infty} \frac{\mu(n)x^n}{1-x^n} = x.$$

(b)
$$\sum_{n=1}^{\infty} \frac{\varphi(n)x^n}{1-x^n} = \frac{x}{(1-x)^2}.$$

(c)
$$\sum_{n=1}^{\infty} \frac{n^{\alpha}x^n}{1-x^n} = \sum_{n=1}^{\infty} \sigma_{\alpha}(n)x^n.$$

(d)
$$\sum_{n=1}^{\infty} \frac{\lambda(n)x^n}{1-x^n} = \sum_{n=1}^{\infty} x^{n^2}.$$

(e) *Use the result in (c) to express $g_2(\tau)$ and $g_3(\tau)$ in terms of Lambert series in $x = e^{2\pi i \tau}$.*

*Note. In (a), $\mu(n)$ is the Möbius function; In (b), $\varphi(n)$ is Euler's totient; and in (d), $\lambda(n)$ is Liouville's function.*

*Proof.* Similar to the proof of Exercise 1.11.

$$\sum_{n=1}^{\infty} f(n)\frac{x^n}{1-x^n} = \sum_{n=1}^{\infty} f(n) \sum_{r=1}^{\infty} x^{rn}$$

$$= \sum_{n=1}^{\infty}\sum_{r=1}^{\infty} f(n)x^{rn}$$

$$= \sum_{n=1}^{\infty} \underbrace{\left(\sum_{d|n} f(d)\right)}_{=F(n)} x^n.$$

□

*Proof of (a).* Theorem 2.1 in the textbook: *T. M. Apostol, Introduction to Analytic Number Theory* shows that

$$F(n) := \sum_{d|n} \mu(d) = \begin{cases} 1 & \text{if } n = 1, \\ 0 & \text{if } n > 1. \end{cases}$$

Hence
$$\sum_{n=1}^{\infty} \mu(n)\frac{x^n}{1-x^n} = \sum_{n=1}^{\infty} F(n)x^n = x.$$

□

*Proof of (b).* Theorem 2.2 in the textbook: *T. M. Apostol, Introduction to Analytic Number Theory* shows that $F(n) := \sum_{d|n} \varphi(d) = n$. Hence

$$\sum_{n=1}^{\infty} \varphi(n) \frac{x^n}{1-x^n} = \sum_{n=1}^{\infty} F(n)x^n = \sum_{n=1}^{\infty} nx^n = \frac{x}{(1-x)^2}.$$

□

*Proof of (c).* Since

$$F(n) := \sum_{d|n} d^\alpha = \sigma_\alpha(n),$$

we have

$$\sum_{n=1}^{\infty} n^\alpha \frac{x^n}{1-x^n} = \sum_{n=1}^{\infty} F(n)x^n = \sum_{n=1}^{\infty} \sigma_\alpha(n)x^n.$$

□

*Proof of (d).* Theorem 2.19 in the textbook: *T. M. Apostol, Introduction to Analytic Number Theory* shows that

$$F(n) := \sum_{d|n} \lambda(d) = \begin{cases} 1 & \text{if } n \text{ is a square,} \\ 0 & \text{otherwise.} \end{cases}$$

Hence

$$\sum_{n=1}^{\infty} \lambda(n) \frac{x^n}{1-x^n} = \sum_{n=1}^{\infty} F(n)x^n = \sum_{n=1}^{\infty} x^{n^2}.$$

□

*Proof of (e).*

(1) Let $q = x = e^{2\pi i \tau}$.

$$g_2(\tau) = \frac{4\pi^4}{3} \left\{ 1 + 240 \sum_{k=1}^{\infty} \sigma_3(k) q^k \right\} \qquad \text{(Theorem 1.18)}$$

$$= \frac{4\pi^4}{3} \left\{ 1 + 240 \sum_{k=1}^{\infty} \frac{k^3 q^k}{1-q^k} \right\} \qquad \text{((c)).}$$

(2) Similarly,

$$g_3(\tau) = \frac{8\pi^6}{27} \left\{ 1 - 504 \sum_{k=1}^{\infty} \sigma_5(k) q^k \right\} \qquad \text{(Theorem 1.18)}$$

$$= \frac{8\pi^6}{27} \left\{ 1 - 504 \sum_{k=1}^{\infty} \frac{k^5 q^k}{1-q^k} \right\} \qquad \text{((c)).}$$

19

$\square$

**Exercise 1.15.**

*Let*

$$G(x) = \sum_{n=1}^{\infty} \frac{n^5 x^n}{1 - x^n},$$

*and let*

$$F(x) = \sum_{\substack{n=1 \\ (n \ odd)}}^{\infty} \frac{n^5 x^n}{1 + x^n}.$$

(a) *Prove that $F(x) = G(x) - 34G(x^2) + 64(x^4)$.*

(b) *Prove that*

$$\sum_{\substack{n=1 \\ (n \ odd)}}^{\infty} \frac{n^5}{1 + e^{n\pi}} = \frac{31}{504}.$$

(c) *Use Theorem 12.17 in the textbook: T. M. Apostol, Introduction to Analytic Number Theory to prove the more general result*

$$\sum_{\substack{n=1 \\ (n \ odd)}}^{\infty} \frac{n^{4k+1}}{1 + e^{n\pi}} = \frac{2^{4k+1} - 1}{8k + 4} B_{4k+2}.$$

*Proof of (a).*

(1) Consider the general case. *Let*

$$G(x) = \sum_{n=1}^{\infty} \frac{n^{4k+1} x^n}{1 - x^n},$$

*and let*

$$F(x) = \sum_{\substack{n=1 \\ (n \ odd)}}^{\infty} \frac{n^{4k+1} x^n}{1 + x^n}.$$

*Show that $F(x) = G(x) - (2^{4k+1} + 2)G(x^2) + 2^{4k+2}G(x^4)$.*

(2) The identity

$$\sum_{n=1}^{\infty} \frac{x^n}{1 + x^n} = \sum_{n=1}^{\infty} \frac{x^n}{1 - x^n} - 2\sum_{n=1}^{\infty} \frac{x^{2n}}{1 - x^{2n}}$$

is always true. Hence $H(x) := \sum_{n=1}^{\infty} \frac{n^{4k+1} x^n}{1 + x^n} = G(x) - 2G(x^2)$.

20

(3) Note that

$$H(x) = \sum_{\substack{n=1 \\ (n \text{ odd})}}^{\infty} \frac{n^{4k+1}x^n}{1+x^n} + \sum_{\substack{n=1 \\ (n \text{ even})}}^{\infty} \frac{n^{4k+1}x^n}{1+x^n}$$

$$= F(x) + \sum_{n=1}^{\infty} \frac{(2n)^{4k+1}x^{2n}}{1+x^{2n}}$$

$$= F(x) + 2^{4k+1}\sum_{n=1}^{\infty} \frac{n^{4k+1}x^{2n}}{1+x^{2n}}$$

$$= F(x) + 2^{4k+1}H(x^2).$$

Hence

$$F(x) = H(x) - 2^{4k+1}H(x^2)$$
$$= [G(x) - 2G(x^2)] - 2^{4k+1}[G(x^2) - 2G(x^4)]$$
$$= G(x) - (2^{4k+1} + 2)G(x^2) + 2^{4k+2}G(x^4).$$

□

*Proof of (b).* Take $k = 1$ in part (c), we have

$$\sum_{\substack{n=1 \\ (n \text{ odd})}}^{\infty} \frac{n^5}{1+e^{n\pi}} = \frac{31}{12} \cdot \frac{1}{42} = \frac{31}{504}.$$

□

*Proof of (c).*

(1) Let $q = e^{2\pi i\tau}$. So

$$G_{4k+2}(\tau) = 2\zeta(4k+2) + \frac{2(2\pi i)^{4k+2}}{(4k+1)!}\sum_{n=1}^{\infty}\sigma_{4k+1}(n)q^n \qquad \text{(Exercise 1.11)}$$

$$= 2\zeta(4k+2) + \frac{2(2\pi i)^{4k+2}}{(4k+1)!}G(q) \qquad \text{(Exercise 1.14(c))}$$

Hence

$$G_{4k+2}(\tau) - (2^{4k+1} + 2)G_{4k+2}(2\tau) + 2^{4k+2}G_{4k+2}(4\tau)$$

$$= \left[ 2\zeta(4k+2) + \frac{2(2\pi i)^{4k+2}}{(4k+1)!}G(q) \right]$$

$$- (2^{4k+1} + 2) \left[ 2\zeta(4k+2) + \frac{2(2\pi i)^{4k+2}}{(4k+1)!}G(q^2) \right]$$

$$+ 2^{4k+2} \left[ 2\zeta(4k+2) + \frac{2(2\pi i)^{4k+2}}{(4k+1)!}G(q^4) \right]$$

$$= (1 - (2^{4k+1} + 2) + 2^{4k+2}) \cdot 2\zeta(4k+2)$$

$$+ \frac{2(2\pi i)^{4k+2}}{(4k+1)!}[G(q) - (2^{4k+1} + 2)G(q^2) + 2^{4k+2}G(q^4)]$$

$$= (2^{4k+2} - 2)\zeta(4k+2) + \frac{2(2\pi i)^{4k+2}}{(4k+1)!}F(q).$$

(2) By taking $\tau = \frac{i}{2}$, we have

$$F(q) = F(e^{-\pi}) = \sum_{\substack{n=1 \\ (n \text{ odd})}}^{\infty} \frac{n^{4k+1}}{1 + e^{n\pi}}$$

and

$$G_{4k+2}(\tau) - (2^{4k+1} + 2)G_{4k+2}(2\tau) + 2^{4k+2}G_{4k+2}(4\tau)$$

$$= G_{4k+2}\left( \frac{i}{2} \right) - (2^{4k+1} + 2)G_{4k+2}(i) + 2^{4k+2}G_{4k+2}(2i)$$

$$= (-4)^{2k+1}G_{4k+2}(2i) - (2^{4k+1} + 2) \cdot 0 + 2^{4k+2}G_{4k+2}(2i)$$

$$= 0.$$

(Exercise 1.12). Hence

$$0 = (2^{4k+2} - 2)\zeta(4k+2) + \frac{2(2\pi i)^{4k+2}}{(4k+1)!} \sum_{\substack{n=1 \\ (n \text{ odd})}}^{\infty} \frac{n^{4k+1}}{1 + e^{n\pi}}.$$

(3) Theorem 12.17 in the textbook: *T. M. Apostol, Introduction to Analytic Number Theory* shows that

$$\zeta(4k+2) = (-1)^{2k+1+1}\frac{(2\pi)^{4k+2}B_{4k+2}}{2(4k+2)!} = \frac{(2\pi)^{4k+2}B_{4k+2}}{2(4k+2)!}.$$

Hence

$$\sum_{\substack{n=1 \\ (n \text{ odd})}}^{\infty} \frac{n^{4k+1}}{1 + e^{n\pi}} = \frac{2^{4k+1} - 1}{8k + 4}B_{4k+2}.$$

□
